CHAPTER I.—FARMS AND LAND IN FARMS

Introduction.—This chapter presents statistics on the number of farms, land in farms, value of farm land and buildings, and farm population. It provides information on the agricultural use made of our land resources and the adjustments made in these uses through the years. Within recent years, shifts in population and employment, increased employment in nonagricultural pursuits, increased production through improved agricultural practices, mechanization of farms, etc., have materially affected the number of farms and the utilization of land in farms.

Sources of data.—The data presented are from the 1950 Census of Agriculture with comparative data from earlier censuses. This information is supplemented with data on population from the decennial censuses of population, and on the uses of nonfarm lands from estimates of the Bureau of Agricultural Economics, United States Department of Agriculture. The Appendix includes a facsimile of the questionnaire used for taking the 1950 Census of Agriculture.

For the most part, the data from the 1950 Census of Agriculture represent a summation of the replies received to inquiries on questionnaires filled for each farm in the United States; however, the data on the value of farm land and buildings, and the classification of farms reporting by number of acres of woodland pastured and by acres of woodland not pastured, represent estimates based on the reports for only a sample of farms enumerated.

When all data in a table are based on the reports for only a sample of farms, the table carries a headnote to that effect. When only a part of the data in a given table is based on a sample, the sample data are shown in italics. Since estimates based on a sample are subject to sampling errors, the sample totals are not in exact agreement with those obtained by tabulating data for all farms.

For a description of the procedures used in the enumeration and processing of the statistics and of the sampling technique, and for tables giving the reliability of estimates based on the sample, see the Introduction to this volume.

Presentation of statistics.—The statistics are presented as totals for the continental United States, for major geographic areas, and for each of the 48 States and the District of Columbia. The major geographic areas include 9 groups of States, called geographic divisions, and a further grouping showing totals for 3 regions—the North, the South, and the West. An outline map showing the States and the geographic divisions and regions for which totals are shown appears in the Introduction to this volume.

Averages, percentages, and other derived data are provided as aids in using and analyzing the statistics. Comparable data from earlier censuses provide a measure of the changes that have occurred from census to census. Most of the available comparative data for prior censuses are shown in tables for the United States. Historical data for regions, divisions, and States are shown only for selected census years or selected items. In presenting statistics for earlier census years, headnotes, footnotes, or the wording of the stub or column headings indicates any significant lack of comparability which may have resulted from changes in the wording of the inquiries, in the instructions or definitions, or in the procedures followed in collecting and compiling the data. The text gives further information in regard to

the comparability of the data for various items. The tabular presentation is supplemented by graphic presentation through the use of maps and charts.

Other published data.—Data for the territories and possessions are not included in this chapter but may be found in Part 34, "Territories and Possessions," of Volume I, "Counties and State Economic Areas," of the 1950 Census of Agriculture reports.

Data by counties on number of farms, land in farms, land use, and value of land and buildings may be found in Volume I, parts 1 to 33.

Data on farm population by counties may be found in Series P-B, or in Chapter B of Volume II, "Characteristics of the Population," of the 1950 Population reports. The rural-farm population is shown in Table 49 and the urban-farm population in Table 42 in both of these reports. Data for State economic areas (groups of counties within the State having similar agricultural, demographic, climatic, physiographic, and cultural characteristics) on number of farms, land in farms, land use, and value of land and buildings may be found in Volume I of the 1950 Census of Agriculture reports.

Data on number of farms, land in farms, land use, and value of land and buildings, classified by size of farm, appear in Chapter X of this volume; by color, race, and tenure of operator in Chapter XI; by economic class of farm in Chapter XII; and by type of farm in Chapter XIII. Some of the data by these classifications are also presented by counties and by State economic areas in Volume I. (See the Introduction to this volume for availability of data for various classifications and at various geographic levels.)

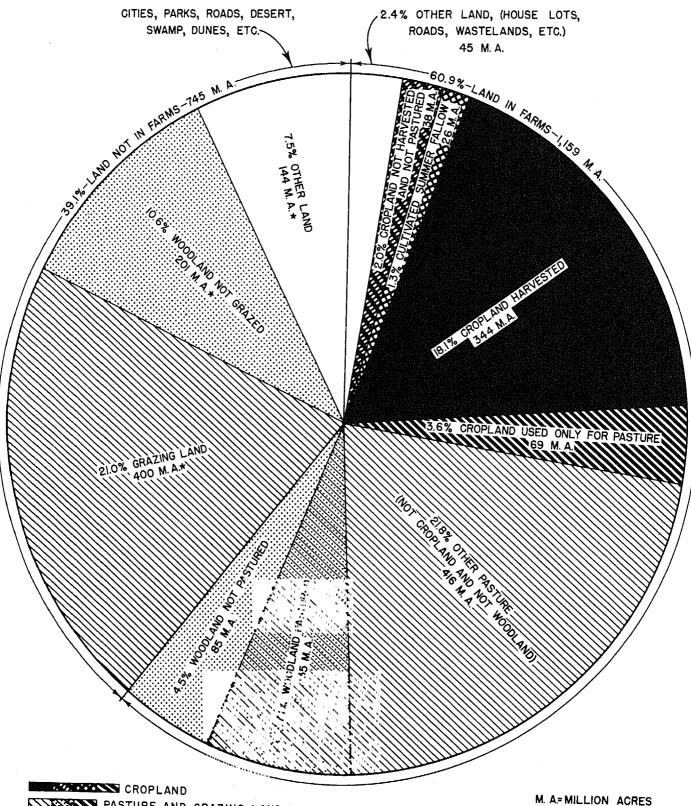

The number of farm operators classified by age, residence, years on farm and off-farm work is presented in Chapter II of this volume.

Additional data on irrigated land and irrigated farms appear in Volume III, "Irrigation of Agricultural Lands," of the 1950 Census of Agriculture reports. County data for irrigated farms covering number of farms, lands in farms, land use, value of land and buildings and the irrigated land in these farms by use, are shown for 17 Western States and Arkansas, Florida, and Louisiana in Volume I.

A more detailed description of the plan of presentation of the data collected in the 1950 Census of Agriculture is given in the Introduction to this volume. For the items covered in the agriculture census see the facsimile of the questionnaire shown in the Appendix.

History of census inquiries on farms and farm property.—Data on number of farms, land in farms, and value of farm land and buildings were obtained for the first time in 1850, the first complete census of agriculture. However, in 1840, information was obtained on specified agricultural products and on numbers of various classes of animals. Figures for all land in farms classified as "improved" and "unimproved" were obtained in all censuses from 1850 to 1920. Unimproved land was subclassified to show woodland in farms in the 1870, 1880, 1910, and 1920 censuses. A more detailed classification of all farm land by use was obtained in the 1925 Census, which classification, with modifications, has been continued.

DEFINITIONS AND EXPLANATIONS

The descriptive terms and explanations refer principally to the 1950 Census of Agriculture, although, in general, they are applicable to earlier censuses. The definitions consist primarily of a résumé of the questionnaire wording, occasionally supplemented by the more essential parts of instructions and procedures for enumerating and processing the questionnaires. For the exact phrasing of the inquiries, reference should be made to the facsimile of the 1950 Agriculture Questionnaire shown in the Appendix.

Definitions having a general application, such as those for "farms reporting," and "operators reporting," and factors influencing the data for numerous items are discussed in the Introduction to this volume and are not discussed in this chapter, unless of particular significance in respect to the subject under consideration.

A farm.—For the 1950 Census of Agriculture, neither the enumerator nor the respondent who filled his own questionannaire was given the definition of a farm. The instructions given the enumerator, as well as the respondent, were explicit as to when to fill a questionnaire. The determination as to which questionnaires represented farms was made in the Washington office. Places of 3 or more acres were counted as farms if the value of agricultural products in 1949, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1949 amounted to \$150 or more. Places operated in 1949 for which the value of agricultural products in 1949 was less than these minima, because of crop failure or other unusual situation, and places operated in 1950 for the first time were dounted as farms if normally they could be expected to produce these minimum quantities of farm products.

All the land under the control of one person or partnership was included as one farm. Control may have been through ownership, or through lease, rental, or cropping arrangement.

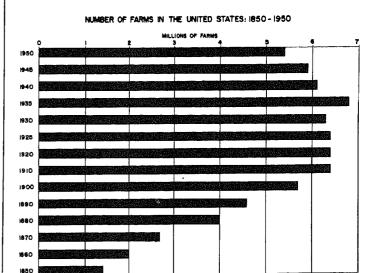

If a person had croppers or other tenants, the land assigned each cropper or other tenant was considered a separate farm, even though the landlord handled the entire holding as one operating unit in respect to supervision, equipment, rotation practices, purchase of supplies, or sale of products. Land retained by the landlord and worked by him with the help of family and/or hired labor was likewise considered a farm. Occasionally, the land retained by the landlord consisted of pastureland not assigned for the exclusive use of a cropper or other tenant, and woodland, or wasteland. Such land, if 3 or more acres in size, was considered a farm, even though the agricultural operations on this retained land may have been insufficient to qualify as a farm.

If a person, who was paid a salary for operating farm lands for others, managed land for two or more employers, all the land managed by him was considered one farm.

In the enumeration of Indian reservations, the enumerator was instructed to obtain a questionnaire for each tract of land of 3 or more acres held by an individual Indian. He was also instructed to obtain a questionnaire for the land held jointly, or used cooperatively. Such cooperative groups included grazing associations, grazing districts, tribal farms, Indian schools, experimental or demonstration farms, and other administrative units. Farms representing such cooperative groups or administrative units accounted for a large part of the Indian agriculture reported in the 1950 Census.

For the 1945 and earlier censuses of agriculture, the definition of a farm was somewhat more inclusive. Census enumerators were provided with the definition of a farm and were instructed to fill reports only for those places which met the criteria. From 1925 to 1945, farms, for Census purposes, included places of

3 or more acres on which there were agricultural operations, and places of less than 3 acres with agricultural products for home use or for sale valued at \$250 or more. For places of 3 or more acres, no minimum quantity of agricultural production was required for purposes of enumeration; for places of under 3 acres all the agricultural products valued at \$250 or more may have been for home use and not for sale. The only reports excluded from the tabulations were those taken in error, and a few

with very limited agricultural production, such as only a small home garden, a few fruit trees, a very small flock of chickens, or the like. In 1945, reports for 3 acres or more were retained if there were 3 or more acres of cropland and pasture, or if the value of products in 1944 amounted to \$150 or more when there was less than 3 acres of cropland and pasture.

The definition of a farm in the 1920 and 1910 Censuses was similar to that used from 1925 to 1940 but was somewhat more inclusive. In those years farms of less than 3 acres with products valued at less than \$250 were to be included provided they required the continuous services of at least one person,

In the definition for 1900, there was no acreage limit. Market, truck, and fruit gardens, orchards, nurseries, cranberry marshes, greenhouses, and city dairies were to be included provided the entire time of at least one person was devoted to their care. For 1890, 1880, and 1870, no tract of less than 3 acres was to be reported as a farm unless \$500 worth of produce was actually sold from it during the year. For 1860, no definition was given the enumerators. In the Census of 1850, no acreage qualification was given in the definition, but there was a lower limit of \$100 for value of products.

The change in the definition of a farm for 1950 resulted in the exclusion of some places with very limited agricultural production which would have qualified as farms under the definitions used in prior censuses. The \$150 minimum for the sale of agricultural products required for farms under 3 acres in size for 1950 excluded an unknown number of places of under 3 acres with production limited to home use, or with only incidental sales, which might have been included had the \$250 minimum for total production been retained. Likewise, the minimum of \$150 agricultural production, whether for home use or for sale, for places of 3 or more acres, resulted in the exclusion of some places which might have qualified as farms under the definition used for prior censuses. See the Introduction to this volume for discussion of the effect of change of definition on the number of farms.

Approximate land area.—Approximate land area includes all land in farms, cities, forests, etc. It includes dry land and land temporarily or partially covered by water, such as marshland, swamps, and river flood plains; streams, sloughs, estuaries, and canals less than one-eighth of a mile in width; and lakes, reservoirs, and ponds having less than 40 acres of area.

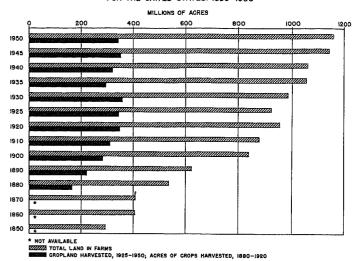

Land in farms.—In 1950, the land to be included in each farm was determined by inquiries on the questionnaire. These inquiries related to the number of acres owned, the acres rented from or worked on shares for others, and the acres rented to or worked on shares by others. The enumerator, or respondent in case he filled his own questionnaire, then obtained the acres in the farm by adding the acres owned and acres rented from or worked on shares for others, and subtracting the acres rented to or worked on shares by others. In case of a managed farm, the person in charge gave the total acreage managed for his employer. From the total managed acreage was subtracted any acreage which was rented to or cropped by others.

In earlier censuses, the inquiries were of this nature: "How many acres in this farm do you own?" and "How many acres in this farm do you rent from others?" The assumption was that the enumerator would instruct the respondent as to what land should be included in his farm. With these two inquiries, space was provided for the enumerator to record the number of acres in the farm. For these earlier censuses, the land included in each farm should have been, in accordance with the instructions, the same as that included in the 1950 Census.

The acreage designated "land in farms" includes considerable areas of land not actually under cultivation and some land not used for pasture or grazing. All woodland and wasteland owned by farm operators, or included in tracts rented from others, is included as land in farms unless such land was held for other than agricultural purposes, or unless the acreage of such land held by a farm operator was unusually large. If the total acreage of land owned, rented, or managed by a farm operator was 1,000 or more (5,000 or more in the Western States) and less than 10 percent of the total was used for crops, pasture, or grazing, or was rented to others, any woodland not grazed and any wasteland, in excess of the acreage used for agricultural purposes, was excluded from the farm area. In the South, where persons often operate large landholdings with croppers and other tenants the entire landholding was considered in applying this procedure.

All grazing land was to be included as land in farms, except range open to community use and grazing lands used under government permit. Land used solely by an operator for which no rent was paid was to be included with land rented from others. Grazing lands operated by grazing associations were to be returned in the name of the manager in charge. All land in Indian reservations used for growing crops, or for grazing livestock, was to be included as farm land. Land in Indian reservations, not reported by individual Indians or not rented to non-Indians, was to be reported in the name of the cooperative group using the land. Thus, in some instances, the entire reservation was reported as one farm.

ALL LAND IN FARMS AND GROPLAND HARVESTED, FOR THE UNITED STATES: 1850-1950

Land not in farms.—Land not in farms was obtained by subtracting the area of land in farms from the approximate land area. Estimates on the uses of nonfarm lands were furnished by the Bureau of Agricultural Economics, United States Department of Agriculture. "Grazing land not in farms" includes federally owned lands administered under the Taylor Grazing Act and grazed under permit, grazing lands included in national forests and grazed under permit, also any other public and privately owned grazing lands which were not included with the farm land areas. The livestock-carrying capacity of much of the range land not in farms is low and a large proportion provides only seasonal grazing.

^{*}Not available.

Land in farms and grazing land not in farms.
 Land in farms; grazing land not in farms; and woodland and forests not in farms.

"Woodland not grazed" represents only a part of the commercial forest area not in farms, as a part of the forest area is grazed and is included in the total for grazing land not in farms. "Other land not in farms" includes land occupied by cities and towns, highways and other roads, railways, airports, parks, reservoirs of less than 40 acres, wildlife refuges, military lands, and other special-use areas, also ungrazed desert, open swamp, rock, sand, and some other lands of low surface value.

Grazing permits.-Information regarding the number of farm operators using nonfarm grazing lands under permit from any public agency or grazing association was obtained for 11 Western States by an inquiry "Do you have a grazing permit?" (from the U.S. Forest Service, Grazing Service, etc.). All land operated under lease and used for agricultural purposes was to be included as land in farms. That portion of Federal, State, and other public lands which was leased for grazing was therefore to be included as land in farms. On the other hand, public lands used for grazing under permit were not included. Likewise, any public and privately owned lands used for grazing without a permit or lease were not to be included as land in farms unless they were used solely by one person.

 $^{^1}$ Figures for land not in farms used for grazing estimated by Bureau of Agricultural Economics, U. S. Department of Agriculture.

Land in farms according to use .- Land in farms in 1950 was classified according to the use made of it in 1949.

The classes are as follows:

Cropland harvested .- This includes land from which crops were harvested; land from which hay (including wild hay) was cut; and land in small fruits, orchards, vineyards, nurseries, and greenhouses. Land from which two or more crops were reported as harvested was to be counted only once.

PERCENT DISTRIBUTION OF FARMS, BY ACRES OF CROPLAND HARVESTED, BY STATES: 1949

The enumerator and the respondent who filled his own questionnaire were instructed to check the reported figure for the

¹ Changes in land area represent changes in boundaries, actual changes due to the construction of reservoirs, to drainage of lakes and swamps, etc., except for 1940, when a complete remeasurement of the United States was made.

2 Estimates of Bureau of Agricultural Economics, U. S. Department of Agriculture.

3 In addition to the estimated nonfarm acreage grazed, there probably were 15 to 20 million acres of nonfarm land having some forage value not used for grazing for various reasons.

farm by adding the acreages of the individual crops reported and subtracting the acres of land from which two crops were barvested.

Comparable data are available for censuses beginning with 1925. For the census years from 1880 to 1920, the acreage of cropland harvested was not enumerated. The figures shown in the tables for those censuses are a summation of the acreages of the individual crops reported. These figures are not strictly comparable with those for later censuses because the totals of acreages of the individual crops do not include all minor crops; they do not include land in farm gardens; and they do not take into account all duplications from harvesting two or more crops in the same year from the same land. Prior to the 1880 Census no acreage figures were obtained for the various crops, the data being limited to production or value.

Cropland used only for pasture.—In the 1950 Census, the enumerator's instructions stated that rotation pasture and all other cropland used only for pasture were to be included under this item. No further definition of cropland pastured was given to the enumerator. The farm operator who filled his own questionnaire answered this inquiry according to his own judgment as to what constituted cropland, i. e., he had no instructions for making his decision. Permanent open pasture may therefore have been included either under this item or under "other pasture" depending on whether the enumerator or farm operator considered it as cropland.

The figures for 1945 and earlier censuses are not entirely comparable with those for 1950. For the Census of 1945, the data are for a more restricted item, 'cropland used only for pasture plowed within 7 years," and for the censuses of 1940, 1935, 1930, and 1925 the data are for a more inclusive item, "plowable pasture."

Cropland not harvested and not pastured.—This item includes idle cropland, land in soil-improvement crops only, land on which all crops failed, land seeded to crops for harvest after 1949 (on which no crop was harvested in 1949), and cultivated summer fallow. Data for the censuses from 1925 to 1945 are available separately for "crop failure" and "cropland, idle or fallow."

In 1950, in the 17 Western States (Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming) information for cultivated summer fallow was obtained separately from other cropland not harvested and not pastured. The acreage of cultivated summer fallow is negligible in the other 31 States. Therefore, for these other States the data are presented as though there is no cultivated summer fallow.

Cultivated summer fallow.—Cultivated summer fallow includes cropland which was plowed and cultivated but left unseeded for several months to control weeds and conserve moisture. No land from which crops were harvested during 1949 was to be included under this item. No separate data on cultivated summer fallow are available for earlier censuses.

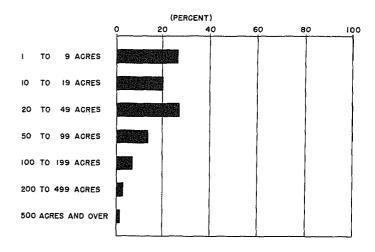

Other cropland.—In the 17 Western States, an additional inquiry to the one for cultivated summer fallow read as follows:

Woodland pastured.—This includes all woodland that was used for pasture or grazing in 1949. No definition of woodland was given in 1950 to either the farm operator or the Census enumerator, except an instruction included in the Enumerator's Reference Manual not to include brush pasture as woodland. Some of the changes from one census to another may represent differences in interpretation of the meaning of woodland.

Woodland not pastured.—This includes all woodland which was not used for pasture or grazing in 1949. Unusually large tracts of timber land, reported as woodland not pastured, were excluded from the tabulations of land in farms when it was evident that such land was held primarily for nonagricultural purposes.

Other pasture (not cropland and not woodland).—This includes rough and brush land pastured and any other land pas-

PERCENT DISTRIBUTION OF THE NUMBER OF FARMS BY ACRES OF WOODLAND PASTURED, FOR THE UNITED STATES: 1949

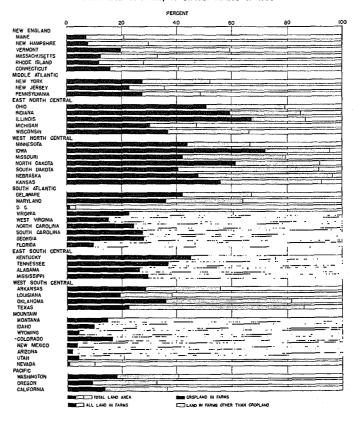

tured which the respondent did not consider as either woodland or cropland.

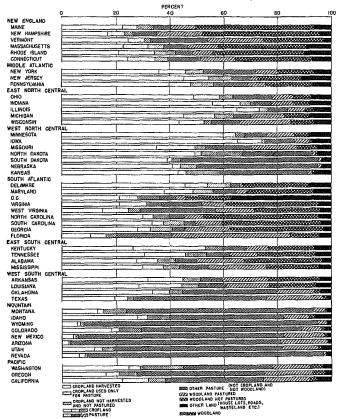

Other land (house lots, roads, wasteland, etc.).—This item includes all house lots, barn lots, lanes, roads, ditches, and wasteland. It includes all land which does not belong under any of the other land-use classes.

The classes of land are mutually exclusive, i. e., each acre of land was included only once though it may have had more than one use in 1949. If a crop was harvested in 1949 from a given acreage of ground and that acreage was also pastured in that year, such acreage would be counted only once under "cropland harvested" and not under "cropland used only for pasture."

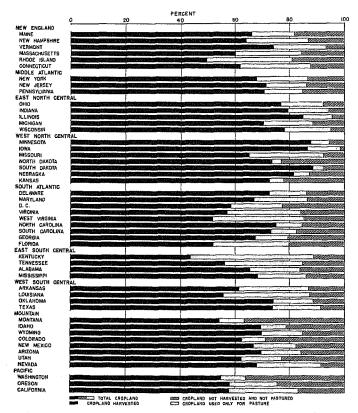

PERCENT OF TOTAL LAND AREA REPRESENTED BY CROPLAND AND OTHER LAND IN FARMS. BY STATES: CENSUS OF 1950

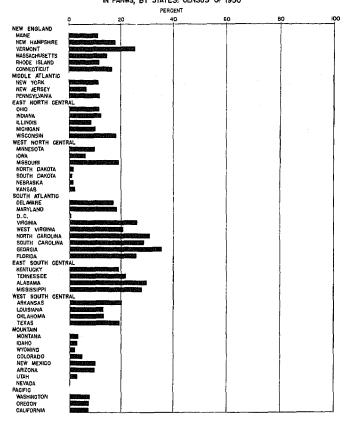

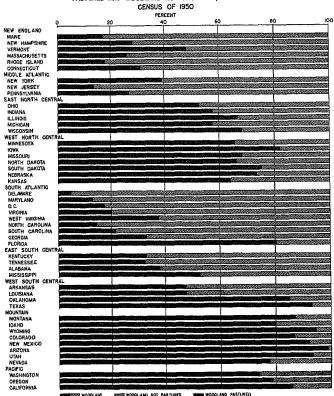

PERCENT OF CROPLAND IN FARMS REPRESENTED BY THE SEVERAL CLASSES, BY STATES: CENSUS OF 1950

PERCENT OF TOTAL LAND AREA REPRESENTED BY WOODLAND IN FARMS, BY STATES: CENSUS OF 1950

PERCENT OF WOODLAND IN FARMS REPRESENTED BY WOODLAND PASTURED AND WOODLAND NOT PASTURED, BY STATES:

In addition to the complete classification of land in farms according to use, the tables also present data for three summary classifications. These classes are somewhat overlapping, that is, a part of the acreage included in "cropland, total" is also included in "land pastured, total." Likewise, a part of the acreage included in "land pastured, total" is also included in "woodland, total."

Cropland, total.—This includes cropland harvested, cropland used only for pasture, and cropland not harvested and not pastured. For 1945, the most nearly comparable general class, "cropland other than cropland pasture not plowed within 7 years" represents a more restricted item than "cropland, total" shown for 1950, while the 1940, 1935, 1930, and 1925 item "land available for crops" is less restricted.

Land, pastured, total.—This includes cropland used only for pasture, woodland pastured, and other pasture (not cropland and not woodland).

Woodland, total.—This includes woodland pastured and woodland not pastured.

Land use classifications for prior censuses.—The land-use classification for the Censuses of 1925 to 1945 was quite similar to that used in the 1950 Census, differing as follows: (1) "Plowable pasture" was used in the 1925 to 1940 censuses instead of "cropland used only for pasture"; (2) in the earlier censuses, there were separate inquiries for crop failure and cropland, idle or fallow; (3) cultivated summer fallow, in the earlier censuses, was included with idle cropland; and (4) in 1940, the inquiry on plowable pasture was the only pasture item on the questionnaire. In 1940, all woodland was grouped into one class, and pasture other than plowable and woodland was included as "all other land."

Prior to 1924, the total acreage of crops for which figures are available, except for 1919 when 14,502,932 acres of corn cut for forage were excluded as most of this was probably dupli-

¹ Prior to 1924, the total acreage of crops for which figures are available, except for 1919 when 14,502,932 acres of corn cut for forage were excluded as most of this was probably duplicated in the acreage of corn harvested as grain.

2 Much of the change from 1944 to 1949 and from 1939 to 1944 due to change in definition.

3 Data are for 17 States for which a soparate inquiry was included on the questionnaires.

4 Much of the change from 1944 to 1949 and from 1934 to 1944 due to change in definition.

5 Cropland barvested from 1944 to 1949 and from 1934 to 1944 due to change in definition.

6 Cropland harvested, cropland used only for pasture, and cropland not harvested and not pastured.

7 Cropland harvested, cropland used only for pasture, and cropland not harvested and not pastured.

8 Cropland harvested, cropland is dealer of allow; and plowable pasture.

9 Nominally includes all land regularly tilled or mowed; land in pasture that has been cleared or tilled; land lying fallow; land in gardens, orchards, vineyards, and nurseries; and all land occupied by buildings, yards, barnyards, etc. See text.

10 Data not strictly comparable. See text.

11 Increase or decrease 1934 to 1939 based on farms reporting and acreage of irrigated cropland harvested only.

12 Increase or decrease 1930 to 1935 based on reports for 19 States only.

13 The total acreage of irrigated crops harvested for 1919 was 9,831,368 (includes some duplications and excludes land in orchards and vineyards), and for 1909 was 7,241,561. The reports for crops grown under irrigation for these years, however, were not considered complete.

Table 5.—Farms Reporting Cropland Harvested, by Number of Acres, for the United States: 1949 and 1944

[Data in italics are based on reports for only a sample of farms. See text. Figures for regions, divisions, and States in table 20]

¹ Cropland harvested, cropland used only for pasture, cultivated summer fallow, and other cropland not harvested and not pastured.
² Wheat, oats, barley, rye, and flaxseed harvested for grain.

Cropland used only for pasture plowed within 7 years is used in this report for the 1945 Census. Figures for this class for 1945 were shown under "cropland used only for pasture" in the 1945 reports and in Volume I, "Counties and State Economic Areas" of the 1950 Census of Agriculture reports. "Cropland used only for pasture plowed within 7 years" included land used only for pasture or grazing that had been plowed within the preceding 7 years. Any additional land used only for pasture considered by the farm operator as cropland was excluded by the 1945 inquiry. Some of the difference between totals for cropland used only for pasture for 1949 and cropland used only for pasture plowed within 7 years for 1944 is the result of differences in the wording of the inquiries.

Plowable pasture as used for the 1925 to 1940 censuses was defined as land used only for pasture or grazing which could have been used for crops without additional clearing, draining, or irrigating. Large acreages of land which had never been plowed and never been considered as cropland were included under plowable pasture, particularly in the States lying between the Mississippi River and the Rocky Mountains. "Plowable pasture" differs from

the 1950 item "cropland used only for pasture" to the extent that the former includes land pastured (other than cropland) which could have been plowed and used for crops. It differs from the 1945 item "cropland used only for pasture plowed within 7 years" by an additional amount represented by cropland used only for pasture that had not been plowed within 7 years preceding the 1945 Census.

Other pasture (not cropland plowed within 7 years and not woodland) for 1945 and other pasture (not plowable and not woodland) for 1935, 1930, and 1925 differ from the 1950 item "other pasture (not cropland and not woodland)" and from each other, by the same amounts that "cropland used only for pasture plowed within 7 years" and "plowable pasture" and "cropland used only for pasture" differ.

Oropland other than cropland pasture not plowed within 7 years for the 1945 Census represents a summary classification which appears in the 1945 reports as "cropland, total" but differs from the 1950 item "cropland, total" by the same amount that the 1945 item "cropland used only for pasture plowed within 7 years" differs from the 1950 item "cropland used only for pasture."

*Not available.

The figure for the 1945 Census includes cropland harvested, cropland used only for pasture plowed within 7 years, and other cropland not harvested and not pastured.

Land available for crops for the 1925 to 1940 censuses includes cropland harvested; crop failure; cropland, idle or fallow; and plowable pasture. It differs from the 1950 item "cropland, total" and the 1945 item "cropland other than cropland pasture not plowed within 7 years" by the same amounts that "plowable pasture" differs from the 1950 item "cropland used only for pasture" and from the 1945 item "cropland used only for pasture plowed within 7 years."

The items for which comparability from 1925 to 1950 is most affected because of differences in definition are those relating to total cropland, to cropland pastured, and other pasture. The accompanying table shows the differences in the content of these items for the various censuses.

Improved land for 1850 to 1920, in general, included land regularly tilled or mowed; land in pasture that had been cleared or tilled; land lying fallow; land in gardens, orchards, vineyards, and nurseries; and land occupied by buildings, yards, barnyards, etc. Improved land was rather loosely defined at the various censuses, the definition given here representing the one used in the 1920 Census. Prior to 1910, there was no specific mention of land occupied by buildings. In 1900, improved land included all land not classed as unimproved which was defined as "land which has never been plowed, mown, or cropped, including land once cultivated but now grown up to trees and shrubs"; in 1890, permanent meadows or pastures and cultivated forests were included with improved land; in 1880, permanent meadows and pastures were included; in 1870, improved land was identified as "cleared land used for grazing, grass, or tillage, or lying fallow"; in 1860, there were no printed instructions or descriptions; and, in 1850, the instructions again identified improved land as cleared land.

Improved land, as reported for 1850 to 1920, is not exactly comparable with any of the classes of land for 1925 to 1950, but it is more nearly comparable with "cropland, total" for 1950 and 1945 and "land available for crops" for 1925 to 1940.

Irrigation.—Irrigated land is land to which water is applied for agricultural purposes by artificial means. In the 1950 Census, data on total land irrigated in 1949 and on acres irrigated by sprinklers in the same year were obtained for all States. Additional data on irrigation were obtained for 20 States, including the 17 western States and Arkansas, Florida, and Louisiana. In this chapter, data are shown only for the total land irrigated and for land irrigated by sprinklers. Additional data on irrigation are shown in Volume III, "Errigation of Agricultural Lands," and in Volume I, "Counties and State Economic Areas" of the 1950 Census of Agriculture reports.

In the 20 States the additional information obtained on irrigation includes a breakdown of the total irrigated land into four categories according to use, viz, irrigated cropland harvested, irrigated wild grass pasture, irrigated tame grass pasture, and irrigated cropland not harvested and not pastured; and information as to the specific crops irrigated and the sources of the irrigation water as well as information on irrigation enterprises.

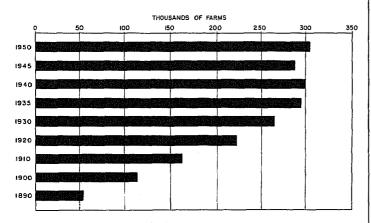

Information on the number of irrigated farms, the total acreage and value of land and buildings, the land in irrigated farms according to use, irrigated land according to use, and classification of irrigated farms by acres irrigated and by tenure of operator, is shown for the 20 States in County Table 1a of the respective parts of Volume I. Data on the individual crops which were wholly irrigated are shown for these States in County Table 5a of the respective parts of Volume I.

Volume III, "Irrigation of Agricultural Lands," includes data from both the census of irrigation and the census of agriculture. It presents data on irrigation enterprises for counties and drainage basins, and a summary for the United States, including the number of enterprises, irrigation works and equipment, sources of water, new capital investment since 1940, cost of irrigation water, the number of farms and acreage irrigated, and quantity of water used for irrigation purposes. Volume III also includes data on number, acreage, and value of irrigated farms, total land in these farms classified according to use and irrigated land in farms by use and the number of irrigated farms by acres irrigated and by the tenure of the operator.

Data relating to irrigation have been obtained in the censuses of agriculture at each decennial census since 1890 and also at the mid-decennial Censuses of 1945 and 1935. For most of these censuses the data were collected for Western States and publication of the data was restricted to those States. For each decennial census beginning with 1900, the number of acres of each crop irrigated was obtained in the census of agriculture. However, these data have not always been considered complete, particularly for the 1920 and 1910 Censuses. At each decennial census, beginning with 1910, there has also been a census of irrigation enterprises. The census of irrigation enterprises covered 20 States in 1950 and 1940, and 19 States in 1930, 1920, and 1910.

IRRIGATED FARMS IN THE UNITED STATES:

(DATA FOR THE VARIOUS CENSUSES NOT STRICTLY COMPARABLE, SEE TEXT)

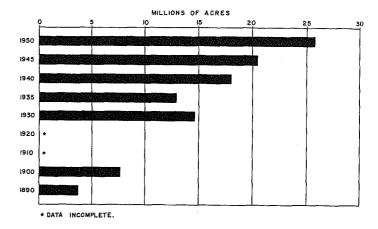

Comparability of irrigation data.—The data shown in this volume on number of farms and acreage irrigated are from the various censuses of agriculture.

The irrigation figures presented in this volume from earlier censuses are not entirely comparable with those for 1950. For 1945 and 1950, the inquiry was for all land irrigated and data were obtained for all States. For 1940, the figures related to irrigated cropland harvested and irrigated pasture in all States. For 1935, the figures relate only to irrigated cropland harvested in all States. For 1930, 1920, and 1910, the figures on irrigated farms relate to farms reporting irrigated crops harvested for 19 States. The acreage figures for 1930 are for 19 States and represent the acreage of irrigated crops, including some duplication where two or more crops were harvested from the same land. For the 1920 and 1910 Censuses, acreages of irrigated crops are available for 19 States but the data were not considered to be complete. Therefore, no acreage figures for these years are included in the tables. For the 1900 and 1800 Censuses, the data relate to the number of irrigators and area irrigated. The data for these years, therefore, are comparable, for each of the 19 States for which the data are available, with those for 1950, with the exception of New Mexico for which the acreage figures

IRRIGATED LAND IN FARMS FOR THE UNITED STATES:

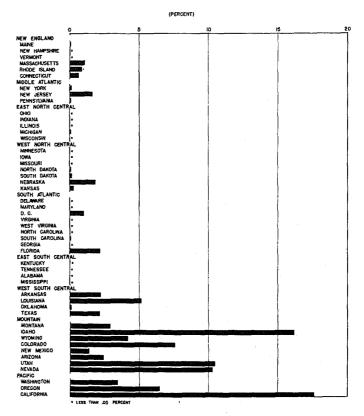

(DATA FOR THE VARIOUS CENSUSES NOT STRICTLY COMPARABLE, SEE TEXT)

do not include the irrigated acres for 1,244 irrigated farms on Indian reservations.

Value of land and buildings.—The value of land and buildings to be reported was the approximate amount for which the land

PERCENT OF ALL LAND IN FARMS REPRESENTED BY IRRIGATED LAND, BY STATES: CENSUS OF 1950

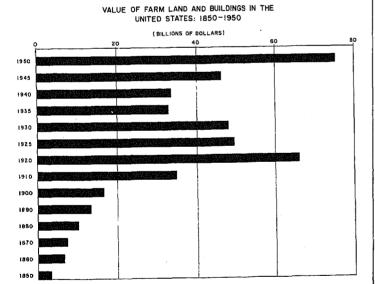

and the buildings on it would sell. The respondent was asked to report either the value per acre or the value of the entire farm. For institutional farms and for places on which there were farming and nonfarm activities, the value of nonfarm structures such as institutional buildings, filling stations, cotton gins, tourist cabins, etc., was not to be included.

The value of land and buildings was obtained for only a sample of farms. However, the value of land and buildings was not reported for all the farms included in the sample. For the United States, farms for which the value of land and buildings was reported represented 87 percent of the farms and contained 85 percent of the land in the farms included in the sample. The percentage of the farms and the land in farms for which the value of land and buildings was reported is shown by States in Table 10. The value of land and buildings was not only incompletely reported for all farms in the sample, but in some States the values reported were not fully representative. For the Mountain and Pacific States, values of land and buildings were reported for a much smaller percentage of the larger farms than for the smaller farms. As the larger farms contained a higher proportion of grazing lands, the values reported for the farms in the sample were not fully representative of all farms.

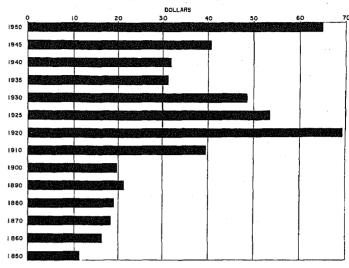

The total value of land and buildings shown for each State, except the 11 Mountain and Pacific States was obtained by multiplying the total acres of land in farms in the State by the average value per acre obtained for the farms included in the sample for which the value of land and buildings was reported. In order to obtain a more accurate figure on values in the 11 Mountain and Pacific States, the total value of land and buildings in each of these States was obtained by multiplying the average value per acre reported for each size-of-farm group by the acres of land in farms for the corresponding size-of-farm group and by adding the calculated total value of land and buildings for all the size-of-farm groups.

The totals for value of land and buildings for geographic divisions were obtained by adding the totals for the States comprising the geographic divisions. Totals for regions and for the United States were obtained also by adding the figures for geographic divisions or regions.

The average values of land and buildings per farm and per acre are shown in Tables 1, 10, and 19. These were obtained by dividing the total value of land and buildings for the United States, for each region and geographic division, and for each of the 11 Mountain and Pacific States, by the total number of farms and by the acres of all land in farms. The average value per farm for all other States was obtained by dividing the total value for each State by the total number of farms for each State. The average values per farm and per acre shown in Volume I and in Chapters X, XI, XII, and XIII of this volume represent averages obtained for the farms included in the sample for which the value of land and buildings was reported. Therefore, the average value

AVERAGE VALUE OF LAND AND BUILDINGS PER ACRE, FOR THE UNITED STATES: 1850-1950

of land and buildings per farm for all States and per acre for the 11 Western States shown in this chapter differ from those given in other chapters of this volume and Volume I.

The value of land and buildings has been obtained for each census, beginning with 1850. The value figures shown for each census presumably represent the market value on the census date, although specific mention of evaluating the property for the amount for which it would sell first appeared in the instructions for the 1900 Census. Prior to that time, the inquiries asked for "cash value" or merely "value," without further qualification. Except for 1870, the values presented in this chapter for each census are the same as are shown in the reports for those censuses. The 1870 figures are the same as those carried in the reports for 1880 and subsequent censuses and represent an adjustment of the original figures to a gold basis. These figures were approximately one-fifth less than the figures reported in 1870.

Population.—Most of the population data presented in this chapter were obtained in the decennial censuses of population. The data on farm population for 1945, 1935, and 1925 were obtained in the censuses of agriculture for those years. The figures shown for total population for 1945, 1935, and 1925 represent estimates of the Bureau of the Census.

Rural population.—As defined by the Bureau of the Census, rural population consists of persons not classed as urban population. Urban population comprises all persons living in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, and villages, (b) incorporated towns of 2,500 inhabitants or more except in New England, New York, and Wisconsin, where "towns" are simply minor civil divisions of counties, (c) the densely settled urban fringe, including both incorporated and unincorporated areas, around cities of 50,000 or more, and (a) unincorporated places of 2,500 inhabitants or more outside any urban fringe.

The figures presented for rural population for 1950 are based on the definition used in the 1940 and 1930 Censuses of Population. According to that definition, rural population was, in general, that residing outside cities and other incorporated places of 2,500 inhabitants or more. The data presented for 1920 and earlier censuses represent revisions on the basis of the 1940 and 1930 definitions and, therefore, are not in exact agreement with those published in the reports for censuses prior to 1930.

Farm population.—In the 1950 Census, farm population was determined largely by the residents themselves. If the respondent, in reply to a direct inquiry, considered his house located on a farm, the house was, in most cases, considered a farm dwelling and the occupants were considered part of the farm population.

Certain types of dwelling units and their occupants, however, were automatically considered nonfarm irrespective of the statement of the respondent or the existence of farming operations on the property. These were:

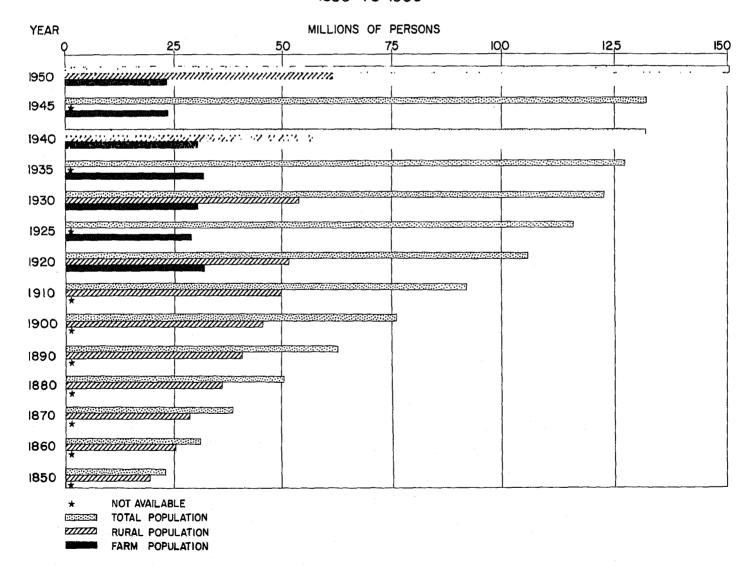

- (1) Farm houses rented by persons who paid cash rent for the house but who did not rent any of the farm land.
 - (2) Tourist cabins built by a farmer on his property.
- (3) Living quarters located on the grounds of an institution (such as a mental or penal institution, old-age home, "poor" farm, school for handicapped children, etc.) even though a farm was operated in conjunction with the institution.

The 1950 figures for farm population cannot be exactly related to the 1950 count of farms. Although enumerators were required to fill agriculture questionnaires for all places which the respondent considered a farm, many of these places did not meet the minimal requirements of \$150 total agricultural production for places of 3 acres or more, or \$150 sales for places under 3 acres. Such places are not included in the count of farms but the people living on them are included in the farm population. In other words, no adjustment was made in the farm population figures when agriculture questionnaires were rejected. On the

other hand, persons on places meeting the requirements of a farm for purposes of the census of agriculture but not considered a farm by the respondent were not included as farm population. See the Introduction to this volume in regard to places for which agricultural questionnaires were required.

The data shown for farm population for earlier censuses are not entirely comparable with those shown for 1950. The data for 1945, 1935, and 1925 were obtained in the censuses of agriculture for those years by asking, for each farm, the number of persons living on that farm. In general, the figures tend to be lower than those obtained in a population census where the enumerator calls on every household. In the population censuses, the classification of farm population has depended more on whether the enumerator considered the household as living on a farm than on whether the place was classed as a farm in the agriculture census. Although the farm population figures shown for 1940, 1930, and 1920 are from the population censuses for these years, they are not fully comparable with the 1950 data because of changes in definition and procedures. The 1950 data are probably less inclusive than those for earlier years, particularly those for 1940. (For further discussion of comparability of the

CHANGES IN FARMS AND LAND IN FARMS

Comparability of the data for 1950 with those for earlier censuses is affected by differences in definitions and procedures. The effect of these differences on the number of farms has been discussed in the Introduction to this volume.

Comparability of totals for land in farms and for the various land uses, particularly at the county level, is also affected by the Census procedure of crediting the entire acreage of a farm, with land in two or more counties, to the county in which the farm headquarters is located. Some of the changes for a county, from one census to another, can often be attributed to changes in the counties to which particular tracts of land are credited. For example, land credited to a farm in one county at one census may later be acquired, through rental or ownership, by a farm in another county. Such land would then be credited to this other county at the next census. These changes resulting from changes in location of the farm headquarters, are important factors affecting the area of land in farms, particularly in the West and other areas where much of the land is leased, or where landholdings are large. Such changes are not important factors in areas where there are few farms containing 1,000 acres or more of land.

In some of the counties in the South, comparability of 1950 data for farms and for land in farms with those for 1945 is affected by differences in the method of enumerating tenant farms closely supervised by the landlord. In 1945, all the farms in a multiple-unit operation were enumerated in the county in which the multiple-unit headquarters was located. For that year, a multiple-unit operation consisted of all the land assigned to closely supervised tenants plus the "home farm" (land retained and operated by the landlord). In 1950, each farm in a multiple unit was enumerated in the county where that particular farm was located. A procedure similar to that for 1950 was also followed in 1940 and earlier censuses.

Changes in the number of farms.—The number of farms in the United States was 5,382,162 in 1950 as compared with 5,859,169 in 1945, a difference of 477,007, or 8.1 percent. Changes in the number of farms are related to changes in the definition of a farm. An analysis of the changes in the number of farms is shown in the Introduction to this volume and reference should be made to that analysis for information regarding changes in the number of farms.

Changes in land in farms.—Land in farms totaled 16,950,488 acres, or 1.5 percent, more in 1950 than in 1945. For the South, the net increase in land in farms was 15,420,461 acres or 4.1 percent. For the West, the increase was 8,417,331 acres or 2.7 percent. However, the acreage of land in farms in the North was 6,887,304 acres, or 1.5 percent less in 1950 than 1945. Land in farms was less in 1950 than in 1945, mainly in all States eastward from Minnesota, Iowa, and Missouri. Decreases in land in farms from 1945 to 1950, accompanied a decrease in the number of farms. Among the geographic divisions, the greatest decrease in land in farms occurred in New England, which had 13.5 percent less acreage in farms and 31.3 percent fewer farms in 1950 than in 1945.

Increases in land in farms consisted largely of increases in woodland and land pastured. In the Mountain and Pacific States. some of the increases may not represent actual gains in land used for agricultural purposes. Some of the increases in land pastured represent grazing lands formerly in open range. Changes in the

administration and management of range lands have increased the acreage of land reported in farms in the Western States. Although much of the Federal grazing land is handled on a permit basis (which land was not to be included as land in farms), there has been an increase in the amount being leased. These leased lands were to be included as land in farms. Reports of the Secretary of Interior for 1950 and 1945 show that, of the grazing lands administered under the Taylor Grazing Act, 13,033,956 acres were leased in 1950 as compared with 11,310,316 acres in 1945 and 7,411,987 acres in 1940.

Some of the increases in the acreage of land in farms may have been the result of changes in definitions and procedures which resulted in obtaining a better enumeration of land controlled by farm operators. The asking for all land owned and for all land rented from others as well as land rented to others, to determine the land in farms, probably resulted in the inclusion of some land which was omitted in earlier censuses when the census enumerator determined the area in each farm. In the South, much of the increase in the land in farms in the landlordtenant area resulted from: (1) the use of the Landlord-Tenant Operations Questionnaire in conjunction with the agriculture questionnaire; (2) the procedure of including all tracts of 3 or more acres retained by landlords who rented their cropland to tenants, as farms; and (3) the procedure of considering the agricultural use of all land in the landlord holding when determining land to be excluded because of nonagricultural use. (See "Land in farms," this chapter, and the Introduction to this volume.)

PERCENT OF TOTAL LAND AREA REPRESENTED BY PASTURE LAND IN FARMS, BY STATES: CENSUS OF 1950

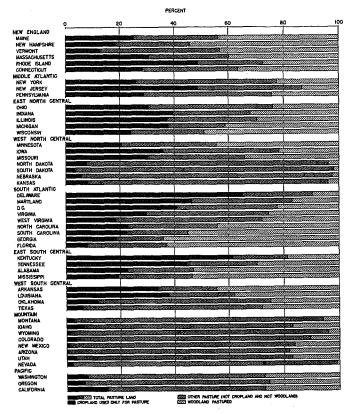

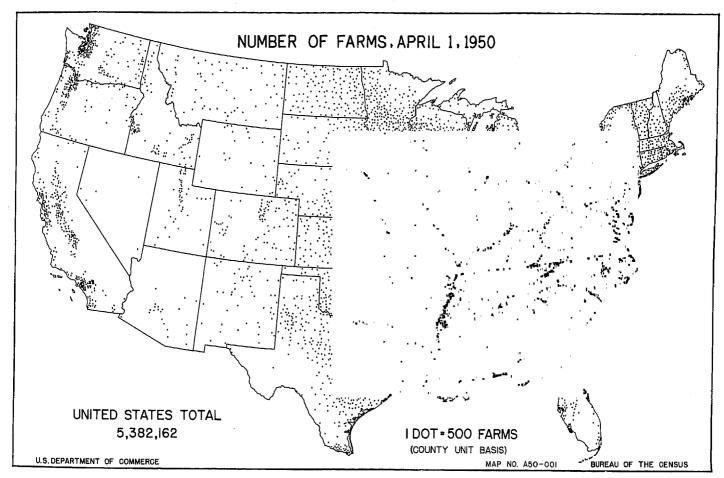

Changes in the use of land in farms.—The most significant changes in land use which occurred between 1945 and 1950, were the increase of cropland harvested in the dry-land farming areas of the Great Plains and the Northwest, the increase in cropland harvested resulting from increased acreages under irrigation, and increases in cropland harvested throughout much of the Corn Belt. Nothwithstanding these increases, there was a net loss for the United States as a whole of 8,467,215 acres of cropland harvested or 2.4 percent. Most of these losses, however, were in the poorer agricultural areas and accompanied losses in farms.

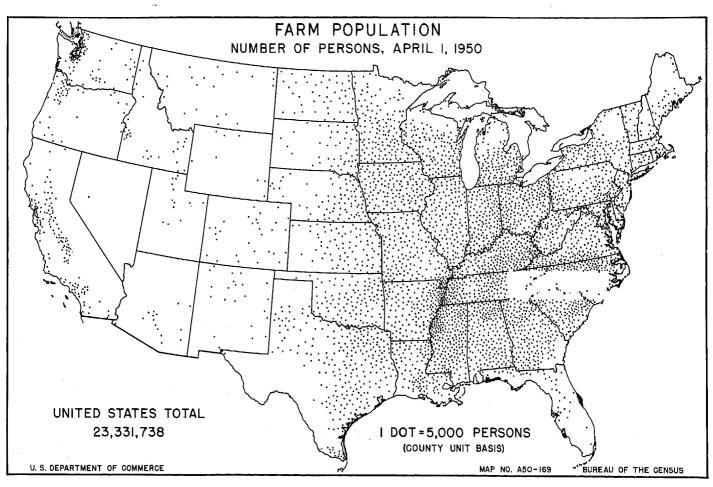

The total acreage of land pastured changed very little, with the United States total for 1950 differing from 1945 by less than 1 percent. The largest decreases were in the northeastern States, accompanying the losses of farms in that area, while the largest increases were in the South, representing part of the increases in total land in that area. Decreases of pasture acreage in the Great Plains and western States occurred because of the increase in cropland harvested in those areas.

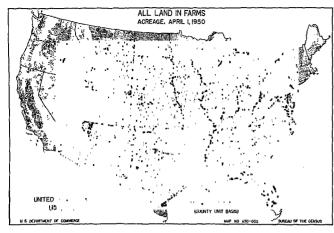

Increases in woodland in farms were rather general in all areas except those where there was a loss in total land in farms. The increases resulted from increases of land in farms, land once cleared becoming covered with woody growth, and from differences in the interpretation of the meaning of woodland. The largest increases in woodland were in Texas where nearly twice as much woodland was reported in 1950 as in 1945. Most of the increases in woodland in Texas resulted from reporting as woodland in 1950 land which was reported as other pasture in 1945.

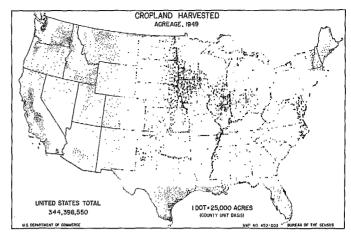

PERCENT OF PASTURE LAND IN FARMS REPRESENTED BY THE SEVERAL CLASSES, BY STATES: CENSUS OF 1950

	Cropland harvested;		الساد						20		and harvested; crop						·

¹Cropland harvested; cropland used only for pasture; and cropland not harvested and not pastured.
²Cropland harvested; cropland used only for pasture plowed within 7 years; and cropland not harvested and not pastured.
³Cropland harvested and not pastured.
⁴The inquiry on cultivated summer fallow was not on the questionnaires for those States in which summer fallow is negligible.
⁵0,05 percent or less.

¹Cropland harvested; cropland used only for pasture; and cropland not harvested and not pastured.
²Cropland harvested; cropland used only for pasture plowed within 7 years; and cropland not harvested and not pastured.
³Cropland harvested; crop failure; cropland, idle or fallow; and plowable pasture.
⁴The inquiry on cultivated summer fallow was not on the questionnaires for those States in which summer fallow is negligible.

ACCORDING TO USE, BASED ON ALL FARMS. BY DIVISIONS AND STATES: CENSUSES OF 1950, 1945, AND 1940

uses of land to 1949, 1944, and 1939. Base data in tables 10 and 13]

[Figures for cropland harvested relate to the crop year immediately preceding the census date; other data relate to the census date: Jan. 1 for 1945, 1935, 1925, and 1920; Apr. 1 for 1950, 1940, and 1930; Apr. 15 for 1910; June 1 for earlier censuses. Data in italics are based on reports for only a sample of farms. See text]

Table 19.—NUMBER OF FARMS, ALL LAND IN FARMS, CROPLAND HARVESTED, AND VALUE OF FARMS, BY REGIONS AND STATES: CENSUSES OF 1850 TO 1950—Continued

[Figures for cropland harvested relate to the crop year immediately preceding the census date; other data relate to the census date: Jan. 1 for 1945, 1935, 1925, and 1920; Apr. 1 for 1950, 1940, and 1930; Apr. 15 for 1910; June 1 for earlier censuses. Data in italics are based on reports for only a sample of farms. See text]

Table 19.—NUMBER OF FARMS, ALL LAND IN FARMS, CROPLAND HARVESTED, AND VALUE OF FARMS, BY REGIONS AND STATES: CENSUSES OF 1850 TO 1950—Continued

[Figures for cropland harvested relate to the crop year immediately preceding the census date; other data relate to the census date: Jan. 1 for 1945, 1935, 1925, and 1920; Apr. 1 for 1950, 1947 and 1930; Apr. 15 for 1910; June 1 for earlier censuses. Data in italics are based on reports for only a sample of farms. See text]

^{*}Not available.

1 Prior to 1924, the data relate to the total acreage of crops for which figures are available, except for 1919 when 14,502,932 acres of corn cut for forage were excluded (as most of this was probably duplicated in the acreage of corn harvested for grain).

2 The total value for each State for 1950 was obtained by multiplying the total land in all farms by the average value per acre based on farms in the sample. See text.

2 The total value for each State for 1950 was obtained by multiplying the total land in all farms by the average value per acre based on farms in the sample. See text.

3 Percentages for 1950 are based on land areas as shown in tables I and 10. Percentages for earlier years are based on land areas, for earlier years are shown in table I. For 1850, the percentage for the United States was based on total land area, including 297,976,960 acres of unorganized territory omitted in the calculations for regions and States.

4 0.05 percent or less.

5 1,000 percent or more.

6 Figures for 1880 were obtained by consolidating data for the counties which then occupied the area now known as North Dakota.

7 The 1870 and 1860 figures are for Dakota Territory.

8 Figures for 1880 were obtained by consolidating data for the counties which then occupied the area now known as South Dakota.

9 In 1860 and 1850, Virginia included the area now known as West Virginia.

10 Figures for 1890 are for Oklahoma Territory and Indian Territory alone, no data for these items being available for Indian Territory; the percent of 11 The 1890 figures for number of farms, farm acreage, and value are for Oklahoma Territory; acreage shown under cropland harvested includes 35,078 acres of cotton in Intotal land area in farms is based on the total land area of Oklahoma Territory; acreage shown under cropland harvested consists of cotton acreage reported for Indian Territory by special agent.

Table 20.—FARMS BY ACRES OF CROPLAND HARVESTED, BY DIVISIONS AND STATES: 1949 AND 1944

[Data in italics are based on reports for only a sample of farms. See text. Figures for all farms and for total farms reporting and acres of cropland harvested are in table 11]

Estimates of Bureau of Agricultural Economics, United States Department of Agriculture.

2 Land in farms and grazing land not in farms.

4 In addition to the estimated nonfarm acreage grazed there probably were 15 to 20 million acres of nonfarm land having some forage value not used for grazing for various reasons.

3 Land in farms, and grazing land not in farms, and gr
