CHAPTER X.—SIZE OF FARM

Introduction.—In the 1950 Census of Agriculture, many of the data were tabulated according to four major classifications of farms, *viz.*, size of farm, color and tenure of the farm operator, economic class of farm, and type of farm. Each of these classifications provides a detailed picture of our agricultural resources and the utilization of the resources by different producing groups.

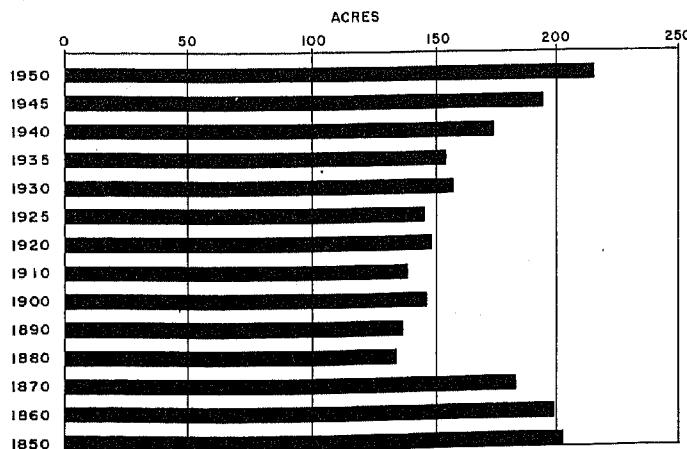

This chapter presents statistics from the 1950 Census of Agriculture for farms classified by size as measured by the total land area in the farm. The data include such items as the number of farms, all land in farms, the value of farm land and buildings (averages only), land use, specified characteristics of the farm operator, specified farm facilities and equipment, farm labor, specified farm expenditures, the principal classes of livestock, the major crops, and sales of farm products. In the presentation, primary emphasis is placed on the number of farms, land in farms, value of farms, and land use.

Farms, as defined by the Census, vary in land area from less than one acre to many thousands of acres. Examples of some of the smaller farms, in terms of land area, are greenhouses, feed lots, broiler plants, and mushroom cellars. Typical of the extremely large operations in terms of land area are the livestock ranches in the West and Southwest.

Sources of data.—The data presented are from the 1950 Census of Agriculture with comparative data from earlier censuses. For the most part, the data from the 1950 Census of Agriculture presented in this chapter are based on the reports for only a sample of farms. Some of the items which were tabulated on a sample basis by size of farm were enumerated for all farms, while others were enumerated only on a sample basis. The totals estimated from the sample usually are not in exact agreement with the enumerated data for all farms. When data are based on the reports for only a sample of farms, the table carries a headnote to that effect.

For a description and explanation of the sampling procedures and for data showing the reliability of estimates based on reports for only a sample of farms, reference should be made to the Introduction to this volume. Also included in the Introduction is a description of the procedures used in the enumeration and in the processing of the statistics. The Appendix includes a facsimile of the questionnaire used for taking the 1950 Census of Agriculture.

AVERAGE SIZE OF FARM, FOR THE UNITED STATES: 1850–1950

Presentation of statistics.—The size-of-farm statistics are presented as totals for the United States, for 3 major regions, for 9 geographic divisions, and for each of the 48 States. An outline map showing the regions, geographic divisions, and States for which totals are shown, appears in the Introduction.

Data in this chapter include comparative data for earlier censuses for number of farms, land in farms, land use, and average value of land and buildings. Some of the tables present data for the 1950 Census only, while other tables include comparative data for earlier census years. Averages, percentages, and other derived data are provided as aids in using and analyzing the statistics. Although totals by size of farm for all of the specified items except farm value are shown for the United States as a whole, space requirements made it necessary to restrict the data for many items shown by States to averages and percentages. For items for which averages or percentages only are presented in this chapter, the base data may be found in the State Economic Area Tables 5 and 9 in Volume I.

The tables are supplemented by charts and maps which show graphically some of the more significant facts included in the tables.

Other published data.—Data by size of farm for counties and States on number of farms and acres in farms and data by size of farm for State economic areas on land use, farm operator characteristics, specified facilities, specified equipment, farm labor, specified farm expenditures, tenure of operator, class of farm, type of farm, and other items may be found in Volume I. (See the Introduction for availability of data for various classifications and at various geographic levels.)

Statistics for various producing groups based on other major classifications are presented in Chapter XI, "Color, Race, and Tenure of Farm Operator"; Chapter XII, "Economic Class of Farm"; and Chapter XIII, "Type of Farm." The economic class of farm is essentially a classification of farms based on size of operations as measured by the gross value of farm products sold. A count of farms by size of farm was made for each group of farms in the other three classifications. These counts are shown for the United States in table 8 of this chapter, and for States and State economic areas in Volume I. The percent distribution of farms by size of farm for each tenure is shown for States in chapter XI of this volume, for each economic class of farm in chapter XII, and for each type of farm in chapter XIII.

A table showing data for specified large farms in the United States appears in the Introduction to this volume. State Table 13 in Volume I shows such data for each State. The specified large farms were not selected solely on the basis of land area; therefore, they may fall within any of the size-of-farm groups for which statistics are presented in this chapter. The criteria used for the selection of the specified large farms appear in the Introduction to this volume.

Counts of farms classified according to the quantities of specified items, such as farms by number of acres of cropland harvested, by acres of specified crops harvested, by numbers of specified kinds of livestock, by amount of expenditures for hired labor, by numbers of hired workers, etc., are shown in the chapters covering these subjects.

Classification of farms by size.—In the 1950 Census of Agriculture, a count of farms by size based on the total land area in each farm was obtained for 13 size-of-farm groups. When

GENERAL REPORT

tabulating the data for land in farms, land use, and other characteristics by size of farm, totals were obtained for only 12 size-of-farm groups. The "under 3 acres" and the "3 to 9 acres" groups for which data were published in prior censuses were tabulated as a single group, "under 10 acres." However, a count of farms is available for the groups of under 3 acres and 3 to 9 acres. In establishing the size classes, consideration was given to the natural groupings which have resulted from the use of the Government land-survey system. Accordingly, the limits for the several size groups, with the exceptions of the extremely small and the extremely large farms, were selected so that each includes a multiple of, or fraction of, a quarter-section of land.

In analyzing size-of-farm statistics, the definition of a farm for purposes of the agriculture census should be taken into account. (See "Definitions and Explanations.") Census farms are considered to be operating units. They do not represent ownership tracts. If a landlord has croppers or other tenants, the land assigned each cropper or tenant is considered to be a separate farm. This is true, even though the landlord may operate the entire holding essentially as a unit in respect to supervision, equipment, rotation practices, purchase of supplies, or sale of products. In such a holding, the tenant farms often consist only of cropland and therefore tend to be smaller than other farms having a similar acreage of crops. The pastureland, woodland, and wasteland which normally would be associated with the cropland may be retained by the landlord. In such cases, the landlord's farm will have a higher proportion of pastureland, woodland, and wasteland than other farms of similar size in the area. In some instances, the expenditures, work power, and farm equipment for the tenant farms may also be reported for the farm operated by the landlord.

History of classification of farms by size.—Tabulations of data by size of farm were first made in the Census of 1860. However, for that year and also for 1870, the classification was based on the acres of "improved land" in the farm rather than on the total acres. Data for the number of farms by size (based on improved land) for these two censuses are shown for the United States in table 1.

¹ For 1860, the classification by acreage of improved land is for "Farms containing 3 acres or more." The number of farms in the various classes adds to 1,955,014 which is 89,063 less than the total number of farms.

The first classification of farms by size, based on the total farm area, was made in 1880. In that year, farms were classified by size into 8 groups. In 1890, the classification provided for only 7 groups, no breakdown having been made that year for farms under 10 acres in size. From 1900 to 1930, the classification was the same as that used in 1880 except that, beginning with 1920, farms of 1,000 acres and over were further classified by size. In 1920 and 1925, a separate classification was shown for farms of 5,000 acres and over; and in 1930, an additional group, 10,000 acres and over, was shown.

In 1935, a revised size classification was established to conform

PERCENT DISTRIBUTION OF THE NUMBER OF FARMS,
BY SIZE, BY STATES: 1950

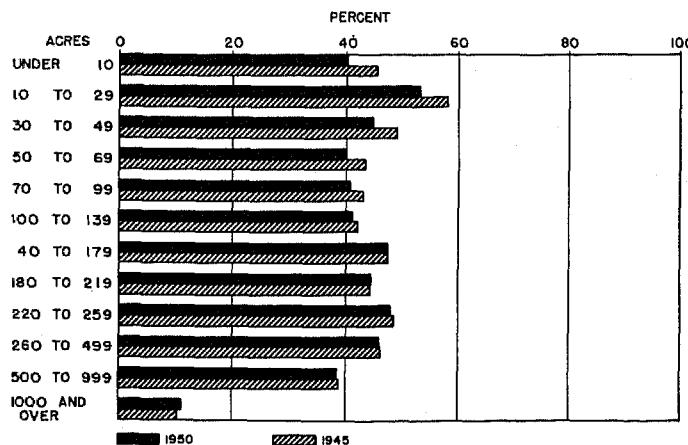

more closely with the Government land-survey system. It avoids some of the bimodal distributions of farms within class intervals which occurred under the classification used for prior censuses. The revised classification is particularly appropriate when farms are made up of fractions or multiples of the Government survey section of 640 acres. Thus, in this new classification, farms of 20, 40, 60, 120, 160 acres, etc., fall at midpoints of the class intervals. The new classification provided for 17 size groups. Some of the 17 groups were subdivided to permit exact comparisons with the size classifications used in the earlier censuses. For continuity, these subclasses were continued in 1940. However, they were not used in 1945 and 1950. For 1940 and 1945, farms of 10,000 acres and over were further classified by size into 7 subgroups, one of which related to farms of 100,000 acres and over. The subclassification of farms of 10,000 acres and over by size appears in Volume II of the 1945 Census of Agriculture reports. In the 1950 tabulations, the 17 size groups established in 1935 were reduced to 13, the size groups of 260 to 379 acres and 380 to 499 acres being combined into the group, 260 to 499 acres; the groups of 500 to 699 and 700 to 999 acres, into the group, 500 to 999 acres; and the groups of 1,000 to 4,999 acres, 5,000 to 9,999 acres, and 10,000 acres and over, being combined into the group, 1,000 acres and over.

Prior to 1900, a count only is available for farms classified by size. Beginning with 1900, the size-of-farm classification included, in addition to a count of farms, data for all land in farms, the more important classes of land according to use, and, except for 1935, the value of farms. For 1950, 1945, and 1940 data for the entire land use classification were tabulated by size of farm. In 1945, most of the major items covered in the census of agriculture were tabulated by States for a sample of farms for the 12 size groups for which data for 1950 are shown in this chapter. This special tabulation of the 1945 Census by size of farm appears in a special report of the 1945 Census of Agriculture entitled, "Farms and Farm Characteristics by Size of Farm."

Size of farm as a measure of size of enterprise.—Because of variations in the quality of land and its suitability for crops or for grazing, farms of similar size of enterprise as measured by their total output may vary greatly in land area. One farm may consist almost entirely of cropland, another may contain a large proportion of woodland or wasteland; again, one may be fertile and another marginal in its productivity. Grouping of farms solely on the basis of the total land area may bring together, in a single size group, farms representing numerous types of agriculture and variations in intensity of production. This is especially true when data for different geographic areas are brought together, such as in State, geographic division, region, or United States totals.

PERCENT OF ALL LAND IN FARMS REPRESENTED BY CROPLAND HARVESTED, BY SIZE OF FARM, FOR THE UNITED STATES: CENSUSES OF 1950 AND 1945

However, within areas which are relatively uniform as to land resources, types of farms, and farm practices, the total output is generally highly correlated with the land area in the farm. Thus, within those States and other areas having somewhat similar agriculture the averages per farm for most inventory and production items increase with an increase in the size of farm. This correlation between averages per farm reporting and size of farm is in evidence even for areas representing considerable diversity in quality of land and in types of farming.

DEFINITIONS AND EXPLANATIONS

Definitions and explanations in this chapter are limited to those which have a particular significance in respect to the presentation of statistics by size of farm. Definitions and explanations of general application are included in the Introduction to this volume and those for specific items may be found in the chapters dealing with those subjects. For the exact phrasing of the inquiries, refer to the facsimile of the agriculture questionnaire shown in the Appendix.

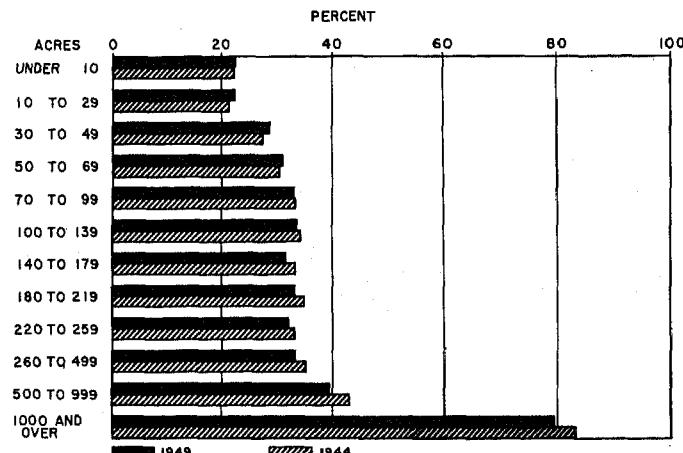

A farm.—For the 1950 Census of Agriculture, places of 3 or more acres were counted as farms if the value of agricultural products in 1949, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1949 amounted to \$150 or more. If a person had croppers or other tenants, the land assigned to each cropper or other tenant was considered a separate farm. Land retained by the landlord and worked by him with the help of family and/or hired labor was likewise considered a farm. Occasionally the land retained by the landlord represented pasture-land (not assigned for the exclusive use of a cropper or other tenant), woodland, or wasteland. Such land, if 3 or more acres in size, was considered a farm for census purposes even though the agricultural operations on the retained land may have been insufficient to qualify as a farm.

If a person, who was paid a salary for operating farm land for others, managed land for two or more employers, all the land managed by him was considered one farm.

For the 1945 and earlier censuses of agriculture, the definition of a farm was somewhat more inclusive. From 1925 to 1945, farms for Census purposes included places of 3 or more acres on which there were agricultural operations, and places of less than 3 acres if the agricultural products for home use and for sale were valued at \$250 or more.

The definition of a farm in the 1920 and 1910 Censuses was similar to that used from 1925 to 1940 but was somewhat more

PERCENT OF ALL LAND IN FARMS REPRESENTED BY LAND PASTURED, BY SIZE OF FARM, FOR THE UNITED STATES: 1949 AND 1944

GENERAL REPORT

inclusive. In those years, farms of less than 3 acres with products valued at less than \$250 were to be included provided they required the continuous services of at least one person.

In the definition for 1900, there were no criteria for minimum acreage or for value of production. Market and truck gardens, fruit orchards, nurseries, cranberry marshes, greenhouses, and city dairies were to be included provided the entire time of at least one person was devoted to their care. For 1890, 1880, and 1870, no tract of less than 3 acres was to be reported as a farm unless \$500 worth of produce was actually sold from it during the year. For 1860, no definition was given the enumerator.

Land in farms.—The land to be included in each farm in 1950 was determined by asking the number of acres owned, the number of acres rented from others or worked on shares for others, and the acres rented to or worked on shares by others. The acres in the farm were obtained by adding the acres owned and the acres rented from or worked on shares for others, and subtracting the acres rented to or worked on shares by others. For a managed farm, the person in charge gave the total acreage managed for his employer. From the total managed acreage was subtracted any acreage which was rented to or cropped by others.

Land in farms includes considerable areas of land not actually under cultivation and some land not used for pasture or grazing. All woodland and wasteland owned by farm operators, or included in tracts rented from others, is included as land in farms unless such land was held for other than agricultural purposes, or unless the acreage of such land held by a farm operator was unusually large. If the total acreage of land owned, rented, or managed by a farm operator was 1,000 or more (5,000 or more in the Western States) and less than 10 percent of the total was used for crops, pasture, or grazing, or was rented to others, any woodland not grazed and any wasteland, in excess of the acreage used for agricultural purposes, were excluded from the farm area.

¹From "Agricultural Statistics, 1950," table 678, United States Department of Agriculture. For 1910, the index number is for that calendar year. For all other years, each index number is for the calendar year preceding the census date.

²"Or requiring for its agricultural operations the continuous services of at least one person."

³No minimum limit used in the 1900 Census on value of products. "All agricultural establishments with less than three acres were reported as farms whenever their operation or management required the constant services of at least one individual."

Except for range open to community use and grazing lands used under government permit, all grazing land was to be included as land in farms. Land used rent free was to be included with land rented from others.

Changes in size of farms.—Changes in the definition of a farm have affected the number of farms included in the various censuses, particularly the number under 3 acres. The effect of changes in definition is discussed in the Introduction to this volume. Table 2 presents the number of farms under 3 acres for each census beginning with 1880, the minimal value criteria relating to such farms as given in the Census definitions, and the index numbers of prices received by farmers.

The change in 1950 in the procedures for determining the acreage in a farm resulted in a better enumeration of land controlled by farm operators.

Many of the changes in size of farm, other than those due to definitions and procedures, occurred because of places which are in and out of agriculture. At one census, such places may have sufficient agricultural production to be counted as farms and at another census, they may have no agricultural production or too limited production to be included as farms. For the most part, such places are small and represent rural homes. The increase in the number of persons living in rural areas who are employed in cities or are dependent on nonfarm incomes has been responsible for much of the general upward trend in the proportion of all farms represented by farms under 10 acres. Also, the variations in the agriculture on such places have been responsible for much of the fluctuation in the numbers included at each census. Table 3 shows the number of farms under 10 acres which have been included in each census beginning with 1880. Farms of under 10 acres increased from 139,241 in 1880 to a high of 594,561 in 1945, slightly more than a three-fold increase. From census to census, farms under 10 acres have shown fluctuations ranging from increases of 77.9 percent in the decade 1890 to 1900 and 59.2 percent in the 5-year period 1930 to 1935 to decreases of 18.4 percent from 1945 to 1950 and 13.8 percent from 1910 to 1920.

Much of the trend toward larger farms, as shown by the distribution of farms by size for the various censuses, has been due to the consolidation of farms into larger operating units made possible by increased mechanization.

GENERAL REPORT

Table 12.—NUMBER OF FARMS BY SIZE OF FARM, BY REGIONS AND STATES: 1880 TO 1950—Continued

[Data in reverse italics indicate size-of-farm groups shown for earlier censuses which do not represent subdivisions or consolidations of the 1950 classification. Data for 1950 are based on reports for only a sample of farms. See text.]

Table 12.—NUMBER OF FARMS BY SIZE OF FARM, BY REGIONS AND STATES: 1880 TO 1950—Continued

[Data in reverse italics indicate size-of-farm groups shown for earlier censuses which do not represent subdivisions or consolidations of the 1950 classification. Data for 1950 are based on reports for only a sample of farms. See text.]

Table 12.—NUMBER OF FARMS BY SIZE OF FARM, BY REGIONS AND STATES: 1880 TO 1950—Continued

[Data in reverse italics indicate size-of-farm groups shown for earlier censuses which do not represent subdivisions or consolidations of the 1950 classification. Data for 1950 are based on reports for only a sample of farms. See text.]

Table 12.—NUMBER OF FARMS BY SIZE OF FARM, BY REGIONS AND STATES: 1880 TO 1950—Continued

[Data in reverse italics indicate size-of-farm groups shown for earlier censuses which do not represent subdivisions or consolidations of the 1950 classification. Data for 1950 are based on reports for only a sample of farms. See text.]

*Not available.

¹0.05 percent or less.

²North Dakota and South Dakota admitted as States in 1889. Figures for 1880 obtained by consolidating data for the counties which then occupied the areas now known as North Dakota and South Dakota, respectively.

³Figures for 1900 are for Oklahoma Territory and Indian Territory; those for 1890 are for Oklahoma Territory alone, no data being available for Indian Territory, no data available for 1880.
