PREFACE

This report presents detailed statistics on various characteristics of the population of the United States distributed by the size of the place in which they live. The data are based on tabulations of a 3 1/3-percent sample of the persons enumerated in the Seventeenth Decennial Census of population of the United States, conducted as of April 1, 1950. Provision for the Seventeenth Decennial Census was made in the act providing for the Fifteenth and subsequent decennial censuses, approved June 18, 1929. The major portion of the information compiled from the Census of Population of 1950 appears in Volume I, Number of Inhabitants, and in Volume II, Characteristics of the Population. These two volumes contain statistics for regions, divisions, States, and parts of States, as well as for the country as a whole.

This is one of a series of reports (Series P-E bulletins) which comprise Volume IV, Special Reports, and supplement the information contained in Volumes I and II. The present bulletin is a preprint of Chapter A of Part 5, of Volume IV.

The materials presented here were prepared under the supervision of Howard G. Brunsman, Chief, Population and Housing Division, and Dr. Henry S. Shryock, Jr., Assistant Chief for Population Statistics, with the assistance of Edwin D. Goldfield, Program Coordinator. They were prepared by Dr. Henry D. Sheldon, Chief, Demographic Statistics Section, assisted by Tobia Bressler and Robert L. Rowland. The compilation of the statistics was under the direction of Robert B. Voight, Assistant Chief for Operations, assisted by Morton A. Meyer, Ruth T. Stanton, and Edward I. Lober. Sampling procedures were under the direction of Joseph Steinberg, Chief, Statistical Sampling Section, assisted by Joseph Waksberg and Albert Mindlin. The technical editorial work and planning were under the supervision of Mildred M. Russell, assisted by Dorothy M. Belzer. The collection of the information on which these statistics were based was under the supervision of Lowell T. Galt, then Chief, Field Division, and the tabulations were under the supervision of C. F. Van Aken, Chief, Machine Tabulation Division.

April 1953.

Characteristics by Size of Place

GENERAL

This report presents statistics on various characteristics of the population--age, race and nativity, years of school completed, mobility status, marital status, family status, employment status, personal income, and major occupation group--by size of place. These statistics are based on a 3 1/3-percent sample of the returns of the Seventeenth Decennial Census of population. They are presented for the United States and in a somewhat abridged form for regions.

RELATED MATERIAL

Statistics on the total population by size of place, based on the complete count, are presented in Volume I, Number of Inhabitants, and in Chapter A of Volume II, Characteristics of the Population. Chapters B and C of Volume II, which contain statistics on the characteristics of the population, do not explicitly distribute the population by size of place. This distribution can be obtained, however, by consolidating the data shown for areas within the size categories desired. Chapter B contains statistics for many types of areas, including urbanized areas and places of 1,000 inhabitants or more, but provides only limited data on the characteristics of the population. Chapter C presents more detailed information but is limited to States, urban and rural, and to the larger cities and standard metropolitan areas.

Additional information by size of place is available in several of the special reports comprising Volume IV. In the report "Education," the statistics on the enrollment in school of children 5 to 13 years of age includes a classification by size of place. The report "Employment and Personal Characteristics" also supplements the data shown here; in the classification of the employment status of the population by size of place, it provides greater detail, in respect to both employment status and age categories, than is shown in this present report. The classification by size of place in the two reports cited, however, differs in several respects from the classification in this report. These differences are discussed in the section on "Size of place," on page 5A-4.

ACCURACY AND INTERNAL CONSISTENCY OF DATA

Since the statistics presented here are based on the $3 \frac{1}{3}$ -percent sample, they are subject to sampling variability and therefore are not expected to agree exactly with figures from the complete count or those from the 20-percent sample. They may also differ in some instances from those on similar subjects which appear in other reports based on the 3 1/3-percent sample. These differences are caused by errors in the tabulation processes. These errors include machine failure, loss of punch cards, and other types. (The net effect is a tendency toward slightly smaller counts of the same item in successive tabulations.) Experience has shown that in mass operations two tabulations of a set of punch cards are not likely to yield precisely identical results. Therefore, tolerance limits allowing for insignificant variations were established in advance for each tabulation. If the differences between the results of two tabulations fall within these limits, nothing was done to bring them into exact agreement with each other. This procedure was adopted in order to provide a greater volume of data within the limits of time and resources available. In earlier censuses, however, the results of different tabulations were adjusted to bring them into exact agreement.

AVAILABILITY OF UNPUBLISHED DATA

All of the data tabulated by size of place are presented for the United States in this report. For regions, however, the statistics are presented in somewhat less detail. The additional detail for regions can be made available for the cost of transcription. Requests for such unpublished statistics, addressed to the Director, Bureau of the Census, Washington 25, D. C., will receive a prompt reply which will include an estimate of the cost of preparing the data.

DEFINITIONS AND EXPLANATIONS

The definitions of the pertinent concepts used in the 1950 Census are given below. Several of these definitions differ from those used in 1940. The changes were made after consultation with users of census data in order to improve the statistics, even though it was recognized that comparability would be adversely affected. In many cases, the new

definitions were tested in connection with the Current Population Survey; and, where feasible, measures of the impact of the change on the statistics were developed.

For a discussion of the definitions of concepts used in the 1950 Census, the quality of the data, and

the problems of comparability with earlier census data, see Volume II, Characteristics of the Population, Part 1, United States Summary, or the Series P-B and Series P-C United States Summary bulletins. The 1950 Population Census schedule and the major part of the instructions to enumerators are also reproduced in Volume II, Part 1.

SIZE OF PLACE

Although data have been compiled in several censuses on the distribution of total population by size of place, no comprehensive set of statistics has previously been published on the characteristics of the population in each size class. Some of the special reports of the 1940 Census (Employment and family characteristics of women, Educational attainment of children by rental value of home, Educational attainment by economic characteristics, and marital status, Women by number of children under 5 years old, and Women by number of children ever born) contained data by size of place for particular characteristics.

There is interest in the similarities and differences of people living in population agglomerations of different sizes. Looked at another way, statistics on this subject show how a particular demographic, social, or economic characteristic varies with size of place. Furthermore, one may examine whether the relationships between various characteristics, such as age and personal income or sex and educational attainment, are fairly constant within each broad range of population size. Since there appeared to be characteristic differences between residents of the suburbs and residents of the central urban area, an attempt has also been made to shed some light on that subject. A tabulation based on a classification of places according to main function (manufacturing cities, mining towns, trade centers, college towns, etc.) would also undoubtedly have produced some interesting comparisons. Such a classification, however, would have involved several kinds of considerations and would have represented a major project.

The census definition of a place as a concentration of population, which may be independent of legal limits, implies the possibility that a place or city may be defined in terms of the entire area of continuous concentrated settlement rather than the area defined by corporate limits. Under this definition a place or physical city includes not only the principal incorporated area or areas but also adjacent suburban and satellite areas. This definition is reflected in the urbanized areas established in connection with cities of 50,000 or more in the 1950 Census.

For cities below this size, urbanized areas have not yet been established; and this fact introduces a degree of discontinuity. The change of unit is made apparent in the tables by the basic dichotomy of urbanized areas and other urban areas. Each urbanized area is recognized as a unit and classified by size on the basis of its total population. It follows then that a number of urban places adjacent to large cities are included in the fringe of urbanized areas and do not appear in the size classes in which they would fall on the basis of their own population. Thus, for example, the Chicago Urbanized Area includes in its fringe such places as Gary, Evanston, and Oak Park.

To isolate the suburban and satellite areas, an urbanized area is divided into its central city or

cities and urban fringe as indicated in the formal definitions below. This distinction between central city and urban fringe is recognized in each size class of urbanized area.

Outside of urbanized areas, the classification by size is simply in terms of the incorporated or unincorporated place. The classification by size is extended into rural areas. The class 1,000 to 2,500 is complete in that it includes all incorporated and all unincorporated places in this size group. The size class of less than 1,000, however, includes only incorporated places; and it is certain that there is a population of appreciable size in unincorporated villages of this size. These, however, were not identified in the census and are included in the residual category "Other rural." The full detail of this classification along with figures on the distribution of the total population appears in table A.

In the transition from urbanized areas to urban places outside of such areas, there is not only a discontinuity in the array of sizes but also a slight overlap of sizes. The former arises from the cut-off at central cities of 50,000. The latter occurred because urbanized areas had to be chosen before the 1950 Census figures were available. The 1950 population of the smallest urbanized area, 56,056, was exceeded by the 1950 population of some six cities which did not attain a population of 50,000 until 1950. In general, however, the lower limit of the urbanized area size class under 250,000 is 50,000, which, with the exceptions noted, is also the upper limit of the size class over 25,000 for urban places outside urbanized areas.

The choice of units to be used in a classification by size of place is somewhat arbitrary. In other reports of this census, there are classifications that use all individual incorporated places and all individual unincorporated places outside urban fringes as units. This system does represent an inconsistent treatment of incorporated and unincorporated suburbs, within urban fringes. The latter have not yet been separately identified anywhere in the 1950 Census. Even if all suburban communities, regardless of incorporation status, had been identified, however, a case might still be made for a unit that represented physical agglomerations in their entirety.

The classification in the other 1950 reports referred to represents a compromise between the present classification and one that simply orders incorporated and unincorporated places of their own size. Their own size is used, but the urban units are stratified into those inside and outside urbanized areas. It is anticipated here that a suburban city of 10,000 will be quite different in its demographic characteristics from an "independent" city of that size.

The categories "Rural nonfarm" and "Rural farm" have sometimes been used as if they represented part of the continuum beginning with urban size classes. Actually farm-nonfarm residence represents a different dimension from size of place. The traditional relationship is superseded here by a cross-classification by farm-nonfarm residence in the rural size classes. It will be observed from the tables that, in many respects, nonfarm people in the open country (outside places of 1,000 or more) are more like farm

people in the open country than they are like nonfarm people in villages (places of less than 2,500).

It has also been suggested that a stratification could usefully be made on the basis of whether the place is inside or outside a standard metropolitan area.

Size classes outside standard metropolitan areas might then be further subdivided in terms of distance from the nearest standard metropolitan area. This approach might well be a very meaningful one for many analytical purposes, but resources limited the number of ways in which the influence of size of place could be examined.

URBAN AND RURAL RESIDENCE

According to the new definition that was adopted for use in the 1950 Census, the urban population comprises all persons living in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, and villages, (b) incorporated towns of 2,500 inhabitants or more except in New England, New York, and Wisconsin, where "towns" are simply minor civil divisions of counties, (c) the densely settled urban fringe, including both incorporated and unincorporated areas, around cities of 50,000 or more, and (d) unincorporated places of 2,500 inhabitants or more outside any urban fringe. The remaining population is classified as rural. According to the old definition, the urban population was limited to all persons living in incorporated places of 2,500 inhabitants or more and in areas (usually minor civil divisions) classified as urban under special rules relating to population size and density.

In both definitions, the most important component of the urban territory is the group of incorporated places having 2,500 inhabitants or more. A definition

of urban territory restricted to such places would exclude a number of equally large and densely settled places, merely because they were not incorporated places. Under the old definition, an effort was made to avoid some of the more obvious omissions by the inclusion of the places classified as urban under special rules. Even with these rules, however, many large and closely built-up places were excluded from the urban territory. To improve the situation in the 1950 Census, the Bureau of the Census set up, in advance of enumeration, boundaries for urban-fringe areas around cities of 50,000 or more and for unincorporated places outside urban fringes. All the population residing in urban-fringe areas and in unincorporated places of 2,500 or more is classified as urban according to the 1950 definition. (Of course, the incorporated places of 2,500 or more in these fringes are urban in their own right.) Consequently, the special rules of the old definition are no longer necessary. Although the Bureau of the Census has employed other definitions in the course of its history, the statistics on the population by urban and rural residence shown for years prior to 1940 are in substantial accordance with the 1940 definition.

URBANIZED AREAS

As indicated above, one of the components of urban territory under the new definition of urban-rural residence is the urban fringe. Areas of this type in combination with the cities which they surround have been defined in the 1950 Census as urbanized areas.

Each urbanized area contains at least one city with 50,000 inhabitants or more in 1940 or according to a special census taken since 1940. Each urbanized area also includes the surrounding closely settled incorporated places and unincorporated areas that comprise its urban fringe. The boundaries of these fringe areas were established to conform as nearly as possible to the actual boundaries of thickly settled territory, usually characterized by a closely spaced street pattern. The territory of an urbanized area may be classified into incorporated parts and unincorporated parts.

The delineation of the boundaries of the urbanized areas had to be completed prior to the beginning of enumeration; consequently, it was not possible to establish urbanized areas in connection with those cities which attained a population of 50,000 or more according to the 1950 Census. Urbanized areas were established for Fort Smith, Ark., and Muskegon, Mich., both of which had in excess of 50,000 inhabitants according to special censuses conducted prior to 1950. The population of both of these cities fell below 50,000 in 1950. The urbanized areas defined for these two cities, however, were retained in the tabulations.

An urbanized area also may be divided into central city or cities and urban fringe as defined below.

Central cities.—Although an urbanized area may contain more than one city of 50,000 or more, not all cities of this size are necessarily central cities. The largest city of an area is always a central city. In addition, the second and third most populous cities in the area may qualify as central cities provided they have a population of at least one-third of that of the largest city in the area and a minimum of 25,000 inhabitants. The names of the individual urbanized areas indicate the central cities of the areas. The sole exception to this rule is found in the New York-Northeastern New Jersey Urbanized Area, the central cities of which are New York City, Jersey City, and Newark.

Urban fringe.--The urban fringe includes that part of the urbanized area which is outside the central city or cities. The following types of areas are embraced if they are contiguous to the central city or cities or if they are contiguous to any area already included in the urban fringe:

- l. Incorporated places with 2,500 inhabitants or more in 1940 or at a subsequent special census conducted prior to 1950.
- 2. Incorporated places with fewer than 2,500 inhabitants containing an area with a concentration of 100 dwelling units or more with a density in this concentration of 500 units or more per square mile. This density represents approximately 2,000 persons per square mile and normally is the minimum found associated with a closely spaced street pattern.
- 3. Unincorporated territory with at least 500 dwelling units per square mile.

4. Territory devoted to commercial, industrial, transportational, recreational, and other purposes functionally related to the central city.

Also included are outlying noncontiguous areas with the required dwelling unit density located within $l\frac{1}{2}$ miles of the main contiguous urbanized part, measured along the shortest connecting highway, and other outlying areas within one-half mile of such noncontiguous areas which meet the minimum residential density rule.

TYPES OF PLACES

The term "place" refers to a concentration of population regardless of legally prescribed limits, powers, or functions. Thus, some areas having the legal powers and functions characteristic of incorporated places are not recognized as places.

Incorporated places.--In a majority of instances, however, the legally prescribed limits of incorporated places serve to delimit concentrations of population. Of the 18,548 places recognized in the 1950 Census, 17,118 are incorporated as cities, towns, villages, or boroughs. In New England, New York, and Wisconsin, however, towns, although they may be incorporated, are minor civil divisions of counties and are not considered as places. Similarly, in the States in which townships possess powers and functions identical with those of villages, the township is not classified as a place. Although areas of this type are not recognized as places, their densely settled portions may be recognized as unincorporated places or as a part of an urban fringe.

Unincorporated places. -- In addition to incorporated places, the 1950 Census recognizes 1,430 unincorporated places. These unincorporated places, which contain heavy concentrations of population, are recognized as places by virtue of their physical resemblance to incorporated places of similar size. To make this recognition possible, the Bureau of the Census has defined boundaries for all unincorporated places of 1,000 inhabitants or more which lie outside the urban fringes of cities of 50,000 inhabitants or more. Because local practice as to incorporation varies considerably from one part of the country to another, some States have very few if any such unincorporated places and others have a great many. Although there are also unincorporated places within the urban fringe, it was not feasible to establish boundaries for such places, and, therefore, they are not separately identified.

FARM POPULATION--URBAN AND RURAL

The farm population for 1950, as for 1940 and 1930, includes all persons living on farms without regard to occupation. In determining farm and nonfarm residence in the 1950 Census, however, certain special groups were classified otherwise than in earlier censuses. In 1950, persons living on what might have been considered farm land were classified as nonfarm if they paid cash rent for their homes and yards only. A few persons in institutions, summer camps, "motels," and tourist camps were classified as farm residents in 1940, whereas in 1950 all such persons were classified as nonfarm. For the United States as a whole, there is evidence from the Current Population Survey that the farm population in 1950

would have been somewhat larger had the 1940 procedure been used. In this report data are presented for the rural-farm population only since virtually all of the farm population is located in rural areas.

RURAL-NONFARM POPULATION

The rural-nonfarm population includes all persons living outside urban areas who do not live on farms. In 1940 and earlier, persons living in the suburbs of cities constituted a large proportion of the rural-nonfarm population. The effect of the new urban-rural definition has been to change the classification of a considerable number of such persons to urban. The rural-nonfarm population is, therefore, somewhat more homogeneous than under the old definition. It still comprises, however, persons living in a variety of types of residences, such as isolated nonfarm homes in the open country, villages and hamlets of fewer than 2,500 inhabitants, and some of the fringe areas surrounding the smaller incorporated places.

MEDIANS

The median, a type of average, is presented in connection with the data on age, years of school completed, and personal income which appear in this report. The median is the value which divides the distribution into two equal parts--one-half of the cases falling below this value and one-half of the cases exceeding this value.

RACE AND COLOR

The concept of race as it has been used by the Bureau of the Census is derived from that which is commonly accepted by the general public. It does not, therefore, reflect clear-cut definitions of biological stock, and several categories obviously refer to nationalities. The information on race is ordinarily not based on a reply to questions asked by the enumerator but rather obtained by observation. Enumerators were instructed to ask a question when they were in doubt.

Color. -- The term "color" refers to the division of population into two groups, white and nonwhite. The group designated as "nonwhite" consists of Negroes, Indians, Japanese, Chinese, and other nonwhite races. Persons of Mexican birth or ancestry who were not definitely Indian or of other nonwhite race were classified as white in 1950 and 1940. In the 1930 publications, Mexicans were included in the group "Other races."

Negro.--In addition to full-blooded Negroes, this classification includes persons of mixed white and Negro parentage and persons of mixed Indian and Negro parentage unless the Indian blood very definitely predominates or unless the individual is accepted in the community as an Indian.

Other races. -- This category includes Indians, Japanese, Chinese, and other nonwhite races.

Mixed parentage.--Persons of mixed parentage are classified according to the race of the nonwhite parent, and mixtures of nonwhite races are generally classified according to the race of the father.

NATIVITY

The classification of the population into the two basic groups, native and foreign born, is based on replies to the question, "What State (or foreign country) was he born in?" A person born in the United States or any of its Territories or possessions is counted as native. Also included as native is the small group of persons who, although born in a foreign country or at sea, were American citizens by birth because their parents were American citizens. The small number of persons for whom place of birth was not reported were assumed to be native.

AGE

The age classification is based on the age of the person at his last birthday as of the date of enumeration, that is, the age of the person in completed years. The enumerator was instructed to obtain the age of each person as of the date of his visit rather than as of April 1, 1950.

POPULATION MOBILITY

The classification of the population by mobility status is made possible by the use of several questions regarding usual place of residence in 1949, that is, usual residence one year prior to the date of the enumeration. The responses to this question were (1) same house, (2) different house in the same county, and (3) county and State of residence for persons whose county of residence in 1949 differed from that in 1950, that is, migrants, and (4) abroad in 1949. An additional question provided information as to whether or not the respondent had lived on a farm in 1949.

For the purposes of this report, the population is classified into persons living in the same house as in 1949 (nonmovers), persons living in a different house in continental United States in 1949 (movers), persons living abroad in 1949, and persons for whom residence in 1949 was not reported.

Movers in turn are classified in two ways. In the first place they are divided on the basis of county and State of residence into persons who moved within a county, persons who moved between counties in the same State (intrastate migrants), and persons who moved between States (interstate migrants). Secondly, they are independently classified into those who lived on a farm in 1949, those who did not live on a farm in 1949, and those for whom farm or nonfarm residence in 1949 was not reported.

The classification by mobility status is limited to the population one year old and over, and the classification relates, of course, only to the two terminal points of the migration period. The number of persons who were living in different houses in 1950 and 1949 is somewhat less than the total number of moves during the year. Some persons in the same house at the two dates had moved during the year but by the time of enumeration had returned to their 1949 residence. Other persons made two or more progressive moves. Furthermore, persons in a different house in the same county may actually have moved between counties during the year but by 1950 had returned to the same county of residence as that in 1949.

FIGURE 2. - CHILDREN UNDER 5 YEARS PER 1,000 WOMEN 20 TO 44 YEARS OLD, BY SIZE OF PLACE, FOR THE UNITED STATES: 1950

YEARS OF SCHOOL COMPLETED

The data on years of school completed were derived from the combination of answers to two questions: (a) "What is the highest grade of school that he has attended?" and (b) "Did he finish this grade?" In the present report, these data are shown for the population 25 years old and over.

The questions on educational attainment applied only to progress in "regular" schools. Such schools are public, private, or parochial schools, colleges, universities, or professional schools, either day or night, full time or part time—that is, those schools where enrollment may lead to an elementary or high school diploma, or to a college, university, or professional school degree. Schooling obtained through a correspondence course was counted only if the course was given by a regular school, such as a university, and the person received credit thereby in the regular school system.

The question on highest grade of schoolattended called for the highest grade attended, regardless of

"skipped" or "repeated" grades, rather than the number of full school years which the person had spent in school.

The question on completion of highest grade was to be answered "Yes" if the person had completed the full grade. If a person was still attending school in that grade, had completed only a half grade, or had dropped out of or failed to pass the last grade attended, the required answer was "No." In this report, persons who failed to report on completion of the grade were assumed to have finished.

The median number of school years completed is expressed in terms of a continuous series of numbers. For example, the fourth year of high school is indicated by 12 and the first year of college by 13. For the sake of comparability, the first year of high school is uniformly represented by 9, although there are some areas with only 7 years of elementary school. The median years of school completed is presented by sex for each size of place class in table B.

MARITAL STATUS

In the 1950 Census, data on marital status are based on the replies to the question, "Is he now married, widowed, divorced, separated, or [has he] never [been] married?" The classification refers to the status at the time of enumeration. Persons classified as "married" comprise, therefore, both those who have been married only once and those who have remarried after having been widowed or divorced. Persons reported as separated or in common-law marriages are classified as married. Those reported as never married or with annulled marriages are classified as single. Since it is probable that some divorced persons are reported as single, married, or widowed, the census returns doubtless understate somewhat the actual number of divorced persons who have not remarried. Persons reported as separated are included in the group designated as "married."

Differences between the number of married men and the number of married women arise from spouses'

having their usual residences in different areas, from variations in the completeness of enumeration of married men and women, and from response and processing errors.

FAMILY STATUS

The classification by family status relates to the living arrangements of the population. At the basis of this classification is the distinction between households (groups of persons living in dwelling units) and quasi households (groups of persons living in hotels, large lodginghouses, institutions, labor camps, and other types of congregate living quarters).

A household includes all the persons who occupy a house, an apartment or other group of rooms, or a room that constitutes a dwelling unit. In general, a group of rooms occupied as separate living quarters is a dwelling unit if it has separate cooking equipment or a separate entrance; a single room occupied as separate living quarters is a dwelling unit if it has separate cooking equipment or if it constitutes the only living quarters in the structure. A household includes the related family members and also the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the dwelling unit. A person living alone in a dwelling unit, or a group of unrelated persons sharing a dwelling unit as partners, is also counted as a household.

One person in each household is designated as the 'head.' The number of heads, therefore, is equal to the number of households. The head is usually the person regarded as the head by the members of the household. Married women are not classified as heads if their husbands are living with them at the time of the census.

Within the household further classification by relationship to head of household yields the categories of the family status classifications. These are as follows:

In primary families.--Persons in primary families comprise the head of a household and the persons living in the household who are related to him. There must be at least two related persons to constitute a family. In this report, these persons are further classified by relationship into head, wife of head, child of head, and other relative of head.

<u>Primary individual</u>.--This category includes heads of households who live alone or with other persons all of whom are unrelated to them.

Nonrelative of household head.--This category includes all persons living in households who are not related to the head of the household, such as lodgers and resident employees.

The population living outside of households is referred to as members of quasi households. For the purposes of this report, this population is classified into two parts—institutional population and other population in quasi households.

Institutional population. -- The institutional population includes those persons living under care in such places as homes for delinquent or dependent children, homes and schools for the mentally or physically handicapped, places providing specialized medical care, homes for the aged, prisons and jails. Staff members and their families are not included in the institutional population.

Other quasi-household member.--This class includes persons in quasi households except those receiving care in institutions. Examples are persons in houses with at least five lodgers and persons in hotels, labor camps, and military barracks.

EMPLOYMENT STATUS

The major concepts involved in the employment status classification are as follows:

Census week.--The 1950 data on employment status pertain to the calendar week preceding the enumerator's visit, which is defined as the "census week."

Employed.--Employed persons comprise all civilians 14 years old and over who, during the census

week, were either (1) "at work"—those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or in a family business; or (2) "with a job but not at work"—those who did not work and were not looking for work but had a job or business from which they were temporarily absent because of vacation, illness, industrial dispute, bad weather, or layoff with definite instructions to return to work within 30 days of layoff. Also included as "with a job" are persons who had new jobs to which they were scheduled to report within 30 days. In this report, these two categories are combined and shown as "Employed."

Unemployed.--Persons 14 years old and over are classified as unemployed if they were not at work during the census week but were either looking for work or would have been looking for work except that (1) they were temporarily ill, (2) they expected to return to a job from which they had been laid off for an indefinite period, or (3) they believed no work was available in their community, or in their line of work.

Labor force. -- The labor force includes all persons classified as employed or unemployed, as described above, and also members of the armed forces (persons on active duty with the United States Army, Navy, Air Force, Marine Corps, or Coast Guard). The "civilian labor force" comprises the employed and unemployed components of the labor force.

Not in labor force.--Persons not in the labor force comprise all civilians 14 years of age and over who are not classified as employed or unemployed, including persons doing only incidental unpaid family work (less than 15 hours). Included in this group are persons primarily engaged in their own home housework, students, seasonal workers in an "off" season, the retired, persons unable to work, inmates of institutions, and persons not reporting on their employment status.

INCOME

Income, as defined in the 1950 Census, is the sum of the money received, less losses, from the following sources: wages or salary; net income (or loss) from the operation of a farm, ranch, business, or profession; net income (or loss) from rents, or receipts from roomers or boarders; royalties; interest, dividends, and periodic income from estates and trust funds; pensions; veterans' payments, armed-forces allotments for dependents, and other governmental payments or assistance; and other income such as contributions for support from persons who are not members of the household, alimony, and periodic receipts from insurance policies or annuities. The figures in this report represent the amount of income received before deductions for personal income taxes, social security, bond purchases, union dues, etc.

Receipts from the following sources were not included as income: money received from the sale of property, unless the recipient was engaged in the business of selling such property; the value of income "in kind," such as food produced and consumed in the home; free living quarters; withdrawals of bank deposits; money borrowed; tax refunds; gifts; and lump-sum inheritances or insurance payments. The median income for persons receiving income is presented by size of place and sex in table C.

MAJOR OCCUPATION GROUP

The data on major occupation group of employed persons presented here refer to the job held during the census week and are based on answers to the question, "What kind of work was he doing?" If the person was employed at two or more jobs, the job at which he worked the greatest number of hours during the census week was reported.

The occupational classification system developed for the 1950 Census of Population consists of 469 items, 270 of which are specific occupation categories; the remainder are subgroupings (mainly on the basis of industry) of 13 of the occupation categories. The 469 detailed items are classified into 12 major occupation groups, which form the basis on which the occupation data are presented in this report. The 1950 major groups are generally comparable with the 1940 major groups, although there are a number of differences in title and content. For further information on comparability between 1950 and earlier census data on occupation, see Volume II, Characteristics of the Population, Part 1, United States Summary.

The composition of the 1950 major groups (except the "not reported" group) is indicated in the illustrative list shown below:

Professional, technical, and kindred workers .--Includes Accountants; Actors; Airplane pilots and navigators; Architects; Artists; Athletes; Auditors; Authors; Chemists; Chiropractors; Clergymen; College presidents, professors, and instructors; Conservationists; Dancers; Dentists; Designers; Dietitians; Draftsmen; Editors; Embalmers; Entertainers; Farm management advisors; Foresters; Funeral directors; Healers; Home management advisors; Judges; Lawyers; Librarians; Musicians; scientists; Nutritionists; Optometrists; Natural Osteopaths; Personnel workers; Pharmacists; Photographers; Physicians; Professional nurses; Radio operators; Recreation workers; Religious workers; Reporters; Social scientists; Social workers; Sports instructors and officials; Student professional nurses; Surgeons; Surveyors; Teachers; Technical engineers; Therapists; Veterinarians.

Farmers and farm managers. -- Includes tenant farmers and share croppers.

Managers, officials, and proprietors, except farm.--Includes Buyers; Building superintendents; Credit men; Lodge officials; Postmasters; Public administration officials; Purchasing agents; Railroad conductors; Ship officers, pilots, pursers, and engineers; Shippers of farm products; Union officials.

Clerical and kindred workers.--Includes Bank tellers; Bill and account collectors; Bookkeepers; Cashiers; Dentist's office attendants; Express agents; Express messengers; Library assistants and attendants; Mail carriers; Messengers; Office boys; Office machine operators; Physician's office attendants; Railway mail clerks; Receiving clerks; Secretaries; Shipping clerks; Station agents; Stenographers; Telegraph messengers; Telegraph operators; Telephone operators; Ticket agents; Typists.

Sales workers.--Includes Advertising agents and salesmen; Auctioneers; Demonstrators; Hucksters; Insurance agents and brokers; Newsboys; Peddlers; Real estate agents and brokers; Stock and bond salesmen.

Craftsmen, foremen, and kindred workers .--Includes Annealers; Bakers; Blacksmiths; Boilermakers; Bookbinders; Brickmasons; Cabinetmakers; Carpenters; Cement finishers; Compositors; Concrete finishers; Coppersmiths; Cranemen; Derrickmen; Die makers; Die setters; Electricians; Electrotypers; Engravers; Excavating machinery operators; Forgemen; Glaziers; Goldsmiths; Grading machinery operators; Heat treaters; Hoistmen; Lens grinders and polishers; Lithographers; Locomotive engineers; Locomotive firemen; Log and lumber scalers and graders; Loom fixers; Machinists, Mechanics; Metal molders; Metal rollers; Metal roll hands; Millers; Millwrights; Motion picture projectionists; Opticians; Organ tuners; Painters (construction and maintenance); Paperhangers; Photoengravers; Piano tuners; Pipe fitters; Plasterers; Plate printers; Plumbers; Power linemen and servicemen; Printing pressmen; Road machinery operators; Roofers; Sheet metal workers; Shoemakers, except in factories; Silversmiths; Slaters; Stationary engineers; Stereotypers; Stone carvers; Stone cutters; Stonemasons; Structural metal workers; Tailors; Telegraph and telephone linemen and servicemen; Tile setters; Tinsmiths; Tool makers; Typesetters; Upholsterers; Watchmakers; Window dressers.

Operatives and kindred workers .-- Includes Apprentices; Asbestos workers; Auto service attendants; Blasters; Boatmen; Bus conductors and drivers; Canalmen; Chauffeurs; Deck hands; Deliverymen; Dressmakers; Dry cleaning operatives; Dyers; Fruit, nut, and vegetable graders and packers; Furnacemen; Insulation workers; Laundry operatives; Meat cutters; Metal filers, grinders, and polishers; Metal heaters; Milliners; Mine operatives and laborers; Motormen; Painters (except construction and maintenance); Parking lot attendants; Photographic process workers; Powdermen; Power station operators; Railroad Brakemen and switchmen; Routemen; Sailors; Sawyers; Seamstresses; Smeltermen; Stationary firemen; Street railway conductors; Surveying chainmen, rodmen, and axmen; Taxicab drivers; Textile spinners; Textile weavers; Tractor drivers; Truck drivers; Welders.

Private household workers.--Includes house-keepers and laundresses in private households.

Service workers, except private household.-Includes Attendants and ushers in amusement places;
Bailiffs; Barbers; Bartenders; Beauticians; Boarding
house keepers; Bootblacks; Bridge tenders; Charwomen; Cooks, except in private households; Detectives; Doorkeepers; Elevator operators; Firemen
(fire protection); Fountain workers; Guards; Hospital
attendants; Janitors; Lodginghouse keepers; Manicurists; Marshals; Midwives; Policemen; Porters;
Practical nurses; Sextons; Sheriffs; Stewards;
Waiters; Watchmen.

Farm laborers and foremen.--Includes both paid and unpaid family farm laborers, and self-employed farm service laborers.

<u>Laborers, except farm and mine</u>.--Includes Car washers; Fishermen; Garage laborers; Grounds-keepers; Longshoremen; Oystermen; Raftsmen; Stevedores; Teamsters; Woodchoppers.

RELIABILITY OF DATA

SAMPLE DESIGN

The data in the tables which follow are based on information tabulated for a representative sample of approximately 3 1/3 percent of the population. A separate line was provided on the population schedule for each person enumerated, with every fifth line designated as a sample line. Within each enumeration district, the schedules were divided approximately equally among five versions. On each version the sample constituted a different set of lines so that each line on the schedule was in the sample on one of the five versions. The statistics in this report are based on tabulations of a systematic selection of one-sixth of the persons on these sample lines, or about 3 1/3 percent of the population.

Estimates of the number of persons with specified characteristics have in all cases been obtained by multiplying the number of persons in the sample with these characteristics by 30. Estimates of percentages have been obtained in each case by using the sample values for both the numerator and denominator.

Although the sampling plan used did not automatically insure an exact 3 1/3-percent sample of persons, it was unbiased and for the United States the deviation from 3 1/3-percent was expected to be quite small for major categories of the population. Small biases, however, arose when the enumerator failed to follow his instructions exactly. These were usually in the direction of a slight underrepresentation of adult males, particularly heads of households in the sample. Errors of processing as noted in the section on "Accuracy and internal consistency of data" resulted in a further reduction in the sample size. (As a result of these errors, a few numbers may not be exact multiples of 30.)

Differences between the columns in table D reflect, among other things, enumerator's errors in selecting the sample, and errors in processing. The net effect of these factors is relatively small and should have little influence on the interpretation of the data. Volume II of the 1950 Census of Population is the source of the 100 percent data.

SAMPLING VARIABILITY

Since the data in this report are based on a sample of the population, they are subject to sampling variability which can be estimated from the standard errors shown in tables E and F. These tables do not reflect the biases mentioned above. Table E presents the approximate standard errors of estimates of selected sizes. Table F shows the approximate standard errors of percentages when computed by using data from this report for both numerator and denominator. For estimates not specifically shown in tables E and F, linear interpolation will provide reasonably accurate results.²

The standard error is a measure of sampling variability. The chances are about 2 out of 3 that the difference due to sampling variability between an estimate and the figure that would have been obtained from a complete count of the population is less than the standard error. The amount by which the standard error must be multiplied to obtain other odds deemed more appropriate can be found in most statistical

¹ In 19 counties of Michigan and Chio, the sample consisted basically of every fifth household and all persons in these households were considered in the sample. Such a household sample was used as an experiment to determine the feasibility of this type of sample in future censuses of population.

^{^2} A closer approximation of a standard error from table E may be obtained by using $x\sqrt{\frac{31}{x}}-\frac{30.5}{T}$ where x is the size of the estimate and T is the total population of the area; in table F, the approximation is $5.6\sqrt{\frac{P(1-P)}{y}}$ where P is the percentage being estimated and y the size of the base. For example, the approximation provided by the above formula of the standard error of an estimate of 8,000,000 in an area with a total population of 15,000,000 is 10,860; linear interpolation would yield about 10,240.

textbooks. For example, the chances are about 19 out of 20 that the difference is less than twice the standard error, and 99 out of 100 that it is less than 2 1/2 times the standard error.

Illustration: Table 1 shows an estimated 18,840 males aged 5 to 13 years living on farms in incorporated places of less than 1,000, in April 1950 (17.2 percent of the 109,260 males living on farms in incorporated places of less than 1,000). From linear interpolation between values in table E it is found that the standard error of an estimate of

18,840 in an area with a total population of 4,010,580 is about 750. Consequently, the chances are about 2 out of 3 that the figure which would have been obtained from a complete count of the number of males aged 5 to 13 living on farms in incorporated places of less than 1,000 differs by less than 750 from the sample estimate. It also follows that there is only about 1 chance in 100 that a complete census would differ by as much as 1,880, that is, by 2 1/2 times the standard error. Table F shows, also by linear interpolation, that the standard error of the 17.2 percent on a base of 109,260 is about 0.7 percent.

The standard errors shown in tables E and F are not directly applicable to differences between two estimates. The standard error of a difference between an estimate based on the sample and one based on a complete count, such as might arise from a comparison of 1950 and 1940 data, is equal to the standard error of the 1950 estimate. The standard error of a difference between two sample estimates is approximately the square root of the sum of the squares of the standard error of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between separate and uncorrelated characteristics. In other cases, however, if there is a high positive correlation between the two characteristics, it will overestimate the true standard error.

Tables E and F are not directly applicable to estimates of medians, if these are computed from the sample data. The sampling variability of estimates of medians depends on the distributions upon which the medians are based.³

The smaller figures and small differences between figures should be used with particular care because they are subject to larger relative error arising from sampling variability and processing and enumeration errors. These figures have been included in the tables to permit analysis of broader groups with smaller relative error.

RATIO ESTIMATES

It is possible to make an improved estimate of an absolute number (improved in the sense that the standard error is smaller) whenever the class in question forms a part of a larger group for which both a sample estimate and a complete count are available. (Complete counts for many of the broader classes for which data are shown, may be found in Volume II of the 1950 Census of Population.) This alternative estimate is particularly useful when the characteristic being estimated is a substantial part of the larger group; when the proportion is small, the improvement will be relatively minor. The improved estimate (usually referred to as a ratio estimate) may be obtained by multiplying a percentage based on sample data by the figure which represents the complete count of the base of the percentage. An alternative method is to multiply the estimate shown in this report by the ratio of the complete count to the sample estimate of the larger group. The last column

³ The standard error of a median based on sample data may be estimated as follows: If the estimated total number reporting the characteristic is N, compute the number $\frac{N}{3}$ - 2.8 \sqrt{N} . Cumulate the frequencies in the table until the class interval which contains this number is located. By linear interpolation, obtain the value below which $\frac{N}{2}$ - 2.8 \sqrt{N} cases lie. In a similar manner, obtain the value below which $\frac{N}{2} + 2.8\sqrt{N}$ cases lie. If information on the characteristic had been obtained from the total population, the chances are about 2 out of 3 that the median would lie between these two values. The chances will be about 19 out of 20 that the median will be in the interval computed similarly but using $\frac{N}{3} \pm 2(2.8)\sqrt{N}$ and about 99 in 100 that it will be in the interval obtained by using $\frac{N}{2}$ ± (2.5) (2.8) \sqrt{N} .

of table D contains such ratios for some major classes of items and can be used to derive ratio estimates.

The effect of using ratio estimates of this type is, in general, to reduce the relative sampling variability from that shown for an estimate of a

given size in table E to that shown for the corresponding percentage in table F. Estimates of these types are not being published by the Bureau of the Census because of the much higher cost necessary for their preparation than for estimates derived by multiplying the sample results by 30.
