**EXPLANATION.**

The following example will illustrate the manner of reading the chart. To find the rainfall of Texas:

Beginning with the extreme eastern portion of the coast, it will be found that a line marked 50 inches curves northward into Louisiana, and thence northwestward to the southwest corner of Arkansas. Directly east of this line is another line marked 55 inches. The average annual rainfall between the two lines ranges, therefore, between 50 and 55 inches, and the only portion of the State of Texas having an annual precipitation of 50 inches and over is found directly east of the line first mentioned.

West of this line the precipitation diminishes, from east to west, regularly at first, as indicated by the various lines marked 45, 40, 35, etc., but after the line of 20 inches is reached the distribution becomes somewhat irregular, and finally is reduced to about 10 inches in the extreme western part of the State.

The amount of rain that falls in dry years ranges from 50 to 60 per cent of the normal; in very wet years the fall may be 140 to 160 per cent of the normal.
