APPENDIX.

FORM OF SCHEDULE FOR THE ENUMERATION OF POPULATION.

The schedule used for the enumeration of population at the census of 1910, an illustrative example of which is given in reduced form on pages 1368 and 1369, was printed on sheets of paper measuring 16 by 23 inches, and each sheet was divided into 100 horizontal lines, 50 lines on each page (A and B) of the sheet. On these lines, numbered from 1 to 100, the answers concerning each person enumerated were entered, and so each sheet, if completely filled, contained the facts required for 100 persons.

The information obtained concerning the members of each family enumerated was entered on successive lines, in the natural order of the family, namely: First, the head; second the wife; then the children (whether sons or daughters) in the order of their ages; and lastly, all other persons living in the family, whether relatives,

boarders, lodgers, or servants.

The dwellings and families visited were numbered (in columns 1 and 2) in the order of their visitation. At the completion of the enumeration of each part of a district, if it contained the whole or parts of two or more civil divisions, the fact was denoted by writing on the line following the last entry for each subdivision the words: "Here ends the enumeration of ——" (naming the city, village, or other incorporated place for which the enumeration is completed).

The schedule in use at the Thirteenth Census corresponded very nearly in general form to those used at

each of the censuses from 1850 to 1880, inclusive, and at the census of 1900; but it differed considerably from the one used at the census of 1890, when the form of the schedule was changed and a family schedule, measuring 15 by 11 inches, was adopted for the enumeration of the population; that is, there was a separate schedule for each family enumerated, without regard to the number of persons in the family.

The statistics regarding the population were tabulated by a punched card system. Under this system a card was prepared for each individual, on which the facts as to sex, race, age, marital condition, place of birth, and the like, were indicated by the punching of appropriate holes. These cards were then sorted according to classes by sorting machines, and the holes representing the various characteristics were counted by tabulating machines. Electric contacts through the punched holes determined the groups into which the cards were sorted, and similar electric contacts operated the counters of the tabulating machines. On account of the complexity of the statistics required, the cards were sorted and run through the tabulating machines several times. The tabulation of the statistics of population in the present report represented the equivalent of handling once on the sorting and tabulating machines more than 700,000,000 cards.

¹ For form of schedule, see Report on Population, Part I, Census of 1890, pages cciv and ccv.
