REPORT ON OCCUPATIONS

CHAPTER I.

ENUMERATION AND CLASSIFICATION OF OCCUPATIONS AT THE THIRTEENTH CENSUS.

ENUMERATION.

Area of enumeration.—The statistics of occupations contained in this volume relate to the total area of enumeration at the Thirteenth Census, taken by the Bureau of the Census as of April 15, 1910. This area includes the mainland of the United States and the outlying territories of Alaska, Hawaii, and Porto Rico. Persons in the military and naval service of the United States stationed abroad (that is, stationed beyond the limits of the United States proper and outside of the outlying possessions included in the area of enumeration in 1910) were also enumerated. This class of persons comprised officers and enlisted men and civilian employees at military and naval stations and on naval vessels abroad, and, in addition, officers' servants and members of families of certain officers and enlisted men and of civilian employees.

San attemption of the United States proper and the property with respect to

occupation schedule at the Thirteenth Census, called for the following statements: First, the "trade or profession of, or particular kind of work done" by each person engaged in gainful labor; second, the "general nature of industry, business, or establishment" in which the person worked; third, whether the person was an employer, an employee, or working on his own account; fourth, if an employee, whether he was out of work on April 15, 1910, and, fifth, if an employee, the number of weeks he had been out of work during the calendar year 1909. The enumerators were instructed to return an occupation for every person engaged in gainful labor, irrespective of age, but as yet no statistics have been prepared on the occupations of children under 10 years of age. The statistics of occupations reported in this volume are limited, therefore, to gainful workers 10 years of age and upward. The term "gainful workers," as used in the printed instructions to enumerators and in this report, includes all workers, except women doing housework in their own homes, without salary or wages, and having no other employment, and children working at home, merely on general household work, on chores, or, at odd times, on other work.

General conditions of enumeration.—The occupation returns for the Thirteenth Census form part of the information obtained in the general enumeration of

population which was taken as of April 15, 1910, through the agency of approximately 70,000 enumerators. The questions concerning occupations were five of the 32 items of inquiry included in the population schedule to be answered, so far as applicable, for each person enumerated. In order to secure a definite statement of the specific occupation, trade, or profession of each person engaged in gainful labor, detailed explanations concerning the manner of returning occupations were given the census enumerators in a book of printed instructions. In addition, the census supervisors were directed to give the enumerators personal instruction prior to the enumeration and to supervise their work during the enumeration. The supervisors were directed, also, to examine and scrutinize the completed schedules received from the enumerators, and, in the event of discrepancies or deficiencies in the same, to cause these to be corrected before sending the schedules to the central office at Washington. But many of the supervisors did not fully observe these requirements, and, as a result, numerous improperly filled schedules reached Washington at a date too late for them to be returned to the enumerators for correction. In general, then, the accuracy of the occupation returns in 1910, as at previous censuses, was dependent very largely upon the intelligence and interest of the army of enumerators. They were more nearly accurate, however, than at any previous census for these two special reasons: The instructions to the enumerators were more definite and emphatic; and the schedule contained two columns for the return of the occupation and the industry or place where it was pursued, instead of one, as at previous censuses. From decade to decade, since the first Federal census of occupations in 1820, doubtless there has been a gradual improvement in the occupation returns, and it is probable that the rate of improvement has been greater with each succeeding decade; but the improvement in the returns in 1910, as compared with those in 1900, probably was far greater than at any preceding decade. This improve-

¹ The paragraphs relating to the portions of the occupation inquiry for which statistics are here presented are reprinted in the Appendix, p. 87.

ment must be attributed largely to the introduction in the schedule of the additional column for the return of the industry or place of employment, for without this information a large percentage of the returns could not have been classified properly. For example, in 1900 the returns for fully one-half of the bookkeepers, clerks, stenographers, and typewriters were given in such general terms that the attempt to distinguish those employed in Government offices, manufacturing establishments, and offices of professional people from those engaged in trade and transportation was rendered futile,1 but in 1910 it was possible to make this distinction for all but about one-eighth of the same classes. And again, while in 1900 "it was necessary to classify persons engaged in manufacturing and mechanical pursuits under general designations denoting the place of work or article produced, rather than under specific terms indicating the kind of work done," because "the proportion of indefiniteness in the returns of the groups of workers comprehending such general designations as makers, workers, employees, laborers, etc.," ranged "from one-fifth to one-half of the whole number of persons in each group," in 1910 the returns for probably not over onetenth of all the persons in the same classes were in such general terms that they could not be classified fairly well according to the kind of work done. In certain industries, however, the proportion of "not specified" returns was considerably over one-tenth of all; and in many cases occupations could not be classified as specifically as desired, but had to be combined with other similar occupations under somewhat general

Enumeration of the negroes of the South.—The occupations of the negroes of the South were less carefully returned by the enumerators than were the occupations of the whites. To a large extent this was due to the greater difficulty of the task, because of the greater amount of ignorance in the negro population, but in part it was due, probably, to the inefficiency or carelessness of the enumerators. The most serious errors in the returns of the occupations of the negroes resulted from some of the enumerators adopting fixed forms for entries in the occupation columns of the schedule and then following these forms without proper regard to the other facts in the individual cases, such as those of age, sex, family relationship, farm ownership, etc. In general, there was too great a tendency among the enumerators to return a gainful occupation for every negro, especially for every negro woman and child. While it is well known that the negro women and children in the South work in the fields much more commonly than do white women and

children in any section of the country, still the returns showed that frequently "gainful" occupations were returned for negro women and children in the South who, elsewhere, would not have been considered gainfully employed.

In the work of editing, many impossible returns of negro persons gainfully occupied were rejected; but in the merely doubtful or somewhat improbable cases the returns of the enumerators were accepted. For these reasons, probably too many negro persons are reported as gainfully occupied.

Enumeration of the Indians.—In general, the occupations of the Indians were not so carefully returned by the enumerators as were the occupations of the whites. No doubt this was due largely to the greater difficulty of the task, but in some cases it was evidently due to the inefficiency or carelessness of the enumerators. In editing the returns, the most improbable cases of Indians returned as gainfully occupied were rejected; but, notwithstanding this, it is probable that too many of the Indians are reported as gainful workers. This is certainly true in the case of particular tribes, where the proportion gainfully employed sometimes exceeds 60 per cent.

Enumeration in Alaska.—In Alaska the enumeration was in the winter. In some of the outlying, sparsely populated districts it was necessary to use as enumerators persons whose education often was quite limited and many of whom had no special clerical spility. Moreover, the Indian population of Alaska illiterate. Under these conditions enumeral was at best difficult. But, because consider fact that the Indians are mainly hunters, trappers, fishermen, and deer herders and keepers, there was little danger of the enumerators confusing occupations. However, some of the Indians may have been missed entirely, and probably others were returned as gainfully occupied when they should not have been. The conditions under which the white population was enumerated were better, but, in many cases, they were quite difficult. This was especially so in case of scattered and migratory miners, fishermen at sea, and men temporarily employed in railroad construction work. The shifting and transient element in the population made it very difficult to avoid omissions and duplications. Agents were placed at the ports of entry and all persons arriving or departing on vessels were enumerated, and in many cases letters were sent persons temporarily away from Alaska. The use of but one column in the Alaska schedules for the return of both the occupation and the industry in which it was pursued, doubtless detracted somewhat from the accuracy of the occupation returns for both the whites and the Indians.

Twelfth Census Report on Occupations, p. xxvi.

CLASSIFICATION.

The new classification of occupations.-From the Federal census of 1850, when the present method of individual enumeration was first inaugurated, until the enumeration in 1910, such a large proportion of the occupation returns were in general and indefinite terms that, in many cases, exact classification according to specific occupation was impossible. Therefore, of necessity, the classification followed was, in many respects, largely industrial in form. Occupations, such as farmer, blacksmith, carpenter, doctor, and lawyer, which, usually, were carefully returned by the enumerators and which could be classified easily apart from industries, were so classified. The remaining occupations, especially in manufacturing industries, were classified under such industrial groups as "Cotton mill operatives," "Woolen mill operatives," etc., without any attempt to distinguish the different specific occupations in each group, such as spinners, weavers, winders, etc. As time passed, this form of classification became more and more inadequate to meet new developments and to satisfy the increased demands for more accurate and detailed information about the occupations of the people. At the Thirteenth Census, it was believed that the special efforts that were being made to secure a more careful return of occupations would be sufficiently successful to justify an attempt at a more exact and scientific classification. A little study showed that mere changes in the old classification would not be sufficient, and that a new classification must be formulated.

Since the value of occupation statistics is dependent very largely upon the form in which the occupations are classified, the basis of classification is of prime importance. After a study of the classifications in use in a number of the principal countries, it was decided that the proper basis for a classification of occupations is the worker and his work, and, hence, that occupations should be classified with respect to the kind of work done or the character of service rendered rather than according to the article made or worked upon, or the place where the work was done. However, since many occupations mean little when considered apart from the industries in which they are pursued. it was believed that the best form of classification for the United States would be an occupational classification with an industrial framework. It was thought that such a classification would give the most vivid picture of the occupational position of each and every worker, and that it would best show the specific services rendered, work done, or processes performed

by each worker. It was seen, too, that this form of classification would allow of expansion or contraction to suit the changes in occupations and industries which it is evident will come with the future industrial development of the country.

In the development of this new classification, each important industry, or service group,² was taken as a separate unit, and each of the specific occupations followed by the workers in it was listed thereunder so far as such occupation was indicated by the returns of the Twelfth Census enumerators. In this manner, each important occupation returned by the enumerators in 1900 was listed separately under its proper industry or service group,³ and these industries and service groups were then divided into eight general divisions.

Heretofore the United States classification of occupations has been rendered illogical and unscientific by the practice of forcing all industries and occupations into five general divisions, namely, agricultural pursuits, manufacturing and mechanical pursuits, trade and transportation, professional service, and domestic and personal service. As a result, accurate general statements often have been impossible, because some of these general divisions have contained distinct industrial and occupational groups. In the new classification, an effort has been made to remedy this defect by increasing the number of general divisions from five to eight. The title of the first general division of the old classification, "Agricultural pursuits," has been expanded to "Agriculture, forestry, and animal husbandry," and fishermen and oystermen have been transferred from "Manufacturing and mechanical pursuits" to this division. The mining and quarrying industries have been transferred from "Manufacturing and mechanical pursuits" to the new division, "Extraction of minerals." The title of the old division, "Manufacturing and mechanical pursuits," has been changed to "Manufacturing and mechanical industries." The old division, "Trade and transportation," has been separated into its two parts, "Trade" and "Transportation," and all public service occupations not elsewhere classified have been brought together under a new division, "Public service." Since the Federal Government, the states, the counties, and the cities employ persons in a great variety of occupations and in many industries, to attempt to classify all these employees under public service would require much duplication and necessitate the breaking up of numerous occupational groups. Therefore, under public service have been classified only those public employees who could not, occupationally, be better classified elsewhere.

¹ The returns in 1850 related only to free males over 15 years of age, but in 1860 they were made to cover free persons of both sexes over 15 years of age. Since 1870 the returns have covered either all persons irrespective of age or those 10 years of age and over. The instructions to enumerators, so far as they relate to occupations, at each census since and including 1870 are reproduced in the Appendix, p. 82.

² Public service, Professional service, and Domestic and personal

service.

The additional important occupations returned at the Thirteenth Census were added later.

The new index to occupations.—In classifying occupations at the Twelfth Census, an index to occupations, based upon that of the Eleventh Census, was used. This index, with approximately 2,600 occupational designations, classed under 475 occupation groups, was entirely inadequate as a guide to the proper classification of the 20,000 or more different occupational designations returned by the enumerators in 1900. It could not be used as a guide to the classification of the returns of 1910, in accordance with the new classification. Therefore, a new index to occupations was prepared. This index was based primarily on the occupations returned by the enumerators at the Twelfth Census. The terms, or designations, actually used by the enumerators in 1900 were copied from the schedules. About 15,000 of the most important of these occupational designations were selected for the index and were classified under the proper industries or service groups of the new classification. The index thus prepared shows the principal industries returned by the enumerators in 1900, the important occupations returned for each of these industries, and the most usual forms of returning such occupations. The new occupations returned in 1910, and the new forms of returning the occupations reported in 1900, have been added to the index, so that it now represents about 17,000 different occupational designations or forms of return. But, since, in most cases, any given occupation in an industry may be designated in two or more ways, the total number of occupations listed under the different industries and service groups of the index is much smaller than the number of occupational designations. And, since, in many cases, a given process of work and the conditions under which it is performed do not vary sufficiently from one industry to another to constitute the process a different occupation in each industry in which it is pursued, the total number of separate and distinct occupations returned at the Thirteenth Census is very much smaller than the total number listed under the different industries and service groups of the index. For example, while the process finishing varies so much from one industry to another that there are a number of distinct occupations, each termed "finisher," as, "finisher coats," "finisher pianos," "finisher steel rails," etc., typewriting is so nearly the same in every business or industry that there is but one occupation termed "typewriter."

Method of classifying occupations in 1910.—Prior to the receipt of the schedules, it was estimated that there would be between 35,000,000 and 40,000,000 persons returned as gainfully occupied. It was evident that these millions of occupation returns, collected by the approximately 70,000 enumerators at the Thirteenth Census, would have to be classified before they could be reported in any scientific manner. It was certain, moreover, that many of the occupations would be returned in such indefinite form that their classification would be difficult. Hence, it was deemed inad-

visable to intrust the classification of all the occupation returns to the regular punching clerks, who were to punch on cards 1 the numerous facts contained in the 27 other columns of the population schedule. On the other hand, it was equally inadvisable to provide a special force to classify all the occupation returns before this information was transferred to the punch cards. Therefore, the work was divided between the regular punching clerks and a special classifying force. A brief list of occupational designations, containing those occupation terms which it was thought would be returned most definitely and most frequently, was prepared for the use of the punching clerks. The proper classification of each of these designations was indicated by a punch symbol. The punching clerks were then instructed to punch only those occupational designations returned on the schedules for which they found exact duplicates in the list. For all indefinite forms of these designations, and for all other designations, they were instructed to punch "Ot," meaning other occupations. These "Ot" occupations, comprising a total of more than 21,000,000 occupation returns, were reserved for examination and classification by a special classifying force.

The force for classifying the "Ot" occupations was divided into small sections, each containing from six to ten clerks under competent supervision. These clerks, each using a copy of the index to occupations, examined the schedules and assigned a punch symbol to each "Ot" occupational designation covered by the index. The "Ot" designations not covered by the index, as well as all doubtful cases, were referred to the section chief for classification and assignment of symbols. All available directories and reports were used as aids in classifying, and frequent reference was made to the Thirteenth Census schedules for manufactures and mines. The punch symbols were written on the schedules by the classifying clerks and later were punched in the cards. The cards were then sorted mechanically by industry and by occupation, and before tabulation the following classes of cards were compared with the original population schedules and the proper corrections made: All cards for females in occupations not usually followed by females, all cards for occupations very unusual in the industry, and all cards for either sex in any industry in which the sex was represented by three persons or less in the tabulation area. After the cards were tabulated, further comparisons and corrections were made in cases of peculiar and unusual occupations, especially where children under 16 years of age were represented as working in occupations thought to be impossible or unusual for persons so young. But an error in the statement of the sex, age, or occupation of a person could not be detected,

¹ At the Thirteenth Census a separate card was used for each person enumerated, to which was transferred by punching, for purposes of later tabulation by electrical machines, all the information returned on the population schedule concerning the color, sex, age, nativity, occupation, etc., of the person.

unless it was inconsistent with the other information returned on the schedule for this same person. Most of the cases in which women and children are reported as working at occupations very unusual for such persons probably are the result of such undetected errors.

Inherent difficulties in classifying occupations.—Certain inherent difficulties make absolutely accurate classification of occupations impossible, and, hence, preclude the possibility of absolutely accurate occupation statistics. First, is the impossibility of making a classification of occupations sufficiently broad and sufficiently detailed to cover all the various activities of the millions of gainful workers in a country with great diversification of industries and with minute division of labor in each industry. Second, is the difficulty due to the great complexity of present day industries and industrial establishments. In many cases there is to-day no definite line of demarcation between industries; and, consequently, processes which generally are considered as belonging to separate and distinct industries frequently are performed in one and the same establishment. This makes it impossible in many cases to determine in which of two closely related industries a given person works, and, hence, makes it impossible to classify all workers properly, according to any definite and logical scheme. In short, the difficulty here is that which results from the necessary attempt to reduce to a fixed and definite classification the workers in an industrial system the organization of which is not only complex but constantly changing. Third, is the impossibility of classifying with complete accuracy occupations which in reality are not clear-cut and well defined. Formerly, under the guild system, to a large degree each workman had a definite occupation or trade, as, cooper, tailor, shoemaker, etc.; but with the transition to the factory system, and the great division of labor which accompanies it, the tendency has been for each of these old handicraft trades to give place to a number of specific processes in the manufacture of the same article. The transition is still in progress, so that to-day a workman may make the whole of an article, or perform several of the processes in its manufacture, or perform only one of them. Moreover, the nature of the processes is

changing continually. This indefiniteness in certain occupations makes their accurate return and classification impossible; and this indefiniteness will remain so long as new processes in manufacturing are being devised.

Practical difficulties in classifying occupations.-In addition to these inherent difficulties, due to the nature of present day industrial organization and, hence, ineradicable, there were, at the Thirteenth Census numerous practical difficulties which, though not inherent and not ineradicable, were, nevertheless, even greater hindrances in the proper classification of occupations and in the securing of accurate occupation statistics. The source of each of these practical difficulties was the same—poor enumeration. In part. this poor enumeration was due to the great difficulty of securing absolutely correct returns from persons who are ignorant, indifferent, or not trained in making accurate statement, or who, as a matter of fact, do not know the precise nature of the occupations followed by persons other than themselves, as was the case with some of those who furnished information to the enumerators; but, in the main, it was due to the carelessness or inefficiency of the enumerators themselves. Their principal errors were: The use of general and indefinite terms; the failure to return for each gainful worker both the occupation and the industry in which it was pursued; the failure to make any return in the occupation columns of the schedule; the return of "None" for persons who evidently were gainfully employed; the return of occupations for persons who evidently were not gainfully employed; the use of stereotyped forms of return, without proper regard to the facts in the individual cases; and the errors due to the misinterpretation of their instructions. The returns of the majority of the enumerators were largely free from these errors; the returns of many of the others were defective in respect to only a part of them; and in case of the returns of only a small minority of the enumerators were they numerous. On the whole, these faulty returns did not constitute a large percentage of the entire number. The most important of them, the degree of success in classifying them, and their effect on the accuracy of the statistics are discussed in the following paragraphs.

OCCUPATIONS CLASSIFIED WITH DIFFICULTY, AND THE ACCUBACY OF THE RESULTANT STATISTICS.

AGRICULTURE.

Farmers and farm laborers.—In 1910, as in 1900, occasionally an enumerator did not distinguish carefully between "farmers" and "farm laborers," but returned all farm workers indiscriminately as the one or the other. From the evidence in the other columns of the schedule, the classifiers were able to correct most of these errors. The number of such errors that could not be so corrected was comparatively small in each case, and it is probable that in any area for which occupation statistics are reported they, to a large extent, balance each other.

"Laborer odd jobs," etc.—A frequent form of return in 1910 was "Laborer odd jobs," "Odd jobs," or "Working out," with no statement as to whether the person so returned worked on a farm or elsewhere. In classifying such returns, the persons were considered to be farm laborers if they lived in unincorporated places and there was no evidence that they were working in construction gangs, lumber camps, or at other nonagricultural work. It is believed that through the operation of this rule most of these errors were corrected.

Children returned as farm laborers.—The enumerators were instructed to return children at work on farms for their own parents as farm laborers—home farm, and to return children at work on farms for others as farm laborers—working out, but many of them failed to make these distinctions carefully. Quite frequently, the young children of a farmer were enumerated with the home family, but were returned in the occupation columns merely as laborers—farm. The classifying clerks were instructed to consider such children, when they were under 16 years of age, as being laborers on the home farm; but, as a large percentage of such returns were punched before the schedules were edited, the attempted division of children returned as farm laborers into farm laborers—home farm and farm laborers—working out was not very successful.

Number of children in agricultural pursuits.—During the decade 1900 to 1910 the increase in the number of children 10 to 15 years of age returned as engaged in agricultural pursuits, especially the increase in the number of females returned as agricultural laborers, was so great as to seem excessive. A careful analysis of the figures (see p. 28 for a full discussion) indicates that during this period there was no such marked increase in the number of children actually engaged in agricultural pursuits, and that the apparent great increase was, to a large extent, the result of a difference in the basis of enumeration at the two censuses, due to a difference in the instructions to the enumerators. It is probable that the Thirteenth Census enumerators, construing their instructions closely, enumerated as gainful workers farm children who would not have been so enumerated by the Twelfth Census enumerators.

Number of women in agricultural pursuits.—The increase from 1900 to 1910 in the number of women returned as engaged in agricultural pursuits was quite marked, being especially large in the case of women returned as farm laborers working on the home farm. As suggested elsewhere (see p. 27 for a full discussion), it is quite probable that this great increase was in part abnormal and was due, primarily, to the difference in the instructions to the enumerators at the two censuses, rather than to any great increase in the proportion of women actually engaged in agricultural pursuits.

MANUFACTURES AND MINING.

Apprentices.—Since in classifying occupations it was impracticable to assign a separate occupation symbol to each kind of apprentice in each of the different industries, all the apprentices in each respective industry, except in the building and hand trades, were classified under the same occupation symbol. The resultant group of apprentices in each industry is not as specific as is desirable, and those apprentices to the building and hand trades who were employed in other industries are reported under those industries and not with "apprentices to building and hand trades."

Brass foundry and iron foundry employees.—The effort to distinguish the employees in brass foundries from the employees in iron foundries was not very successful in places where both brass foundries and iron foundries were located, for, frequently, the returns were merely "Laborer—foundry," "Molder—foundry," etc., without further specification. The employees in brass foundries were classified with the employees in "Brass mills;" and the returns which could not be distinguished as belonging either to brass foundries or to iron foundries were classified under "Not specified metal industries."

Brick, tile, and terra cotta factory employees.—An effort was made to distinguish the workers in brick factories, tile factories, and terra cotta factories, respectively; but this effort met with little success because of the fact that to-day some factories manufacture both brick and tile, and others manufacture both tile and terra cotta. No attempt is made, therefore, to present separate occupation statistics for each of these three industries. It is believed, however, that the occupation statistics reported for the combined industries are approximately correct.

Builders and building contractors.—Notwithstanding the effort made to classify as "Builders and building contractors" only those persons occupied principally in making and carrying out building contracts, and to classify with their respective trades, as carpenters, masons, plasterers, etc., all persons working with their tools, it is believed that the number of "Builders and building contractors" is far too large.

Car shop and railroad repair shop employees.—Much difficulty was experienced in the effort to distinguish the employees of railroad car repair shops from the employees of car building shops, and often this distinction could not be made with certainty. In fact, it is believed that many of the employees of railroad car repair shops were classified with and are reported as employees of car building shops. However, since the occupations are much the same in the two kinds of shops, this failure to keep them separate is not of great consequence occupationally. The industry totals, however, are rendered inaccurate to the extent of the unbalanced error in the classification of the occupations.

Cigar factory and tobacco factory employees.—Since many of the enumerators did not distinguish carefully between the operatives in cigar factories and the operatives in tobacco factories, the occupations in these two industries have been combined. It is believed that the occupation statistics for the combined industries are approximately correct.

Clothing factory employees.—It was frequently difficult to distinguish the makers of "suits, coats, cloaks, and overalls" from the makers of other cloth garments; and often, also, difficulty was experienced in distinguishing between the makers of cloth garments and knit garments, and between the knitters of cotton

and woolen garments and the workers in cotton and woolen mills. Furthermore, in many cases it was hard to distinguish the makers of cloth and knit gloves from the makers of leather gloves.

Hand sewers and sewing machine operators.—Since the enumerators did not distinguish carefully between the hand sewers and the sewing machine operators in factories, it has been necessary to combine them under one head.

Iron foundry and iron manufactory employees.—An effort was made to distinguish the employees of iron foundries from the employees of other establishments engaged in the remanufacture of iron and steel, but so many of the machine shops and factories engaged in the manufacture of implements, machinery, etc., had iron foundries connected with them that a close distinction was impossible.

Steel mills and iron manufactory employees.—An effort was made to distinguish the employees of blast furnaces and steel-rolling mills—the mills which manufacture and roll iron and steel-from the employees of the factories which remanufacture iron and steel into hardware, implements, machinery, etc., but this effort was not entirely successful. In the first place, many of the enumerators, where they could have done so, failed to distinguish between steel mills and the factories which remanufacture iron and steel. In the second place, the enumerators often found it impossible to specify a given establishment either as a steel-rolling mill or as a factory engaged in the remanufacture of iron and steel, for it was both. The fact that to-day the steel industry is not clear-cut and distinct, but frequently overlaps the iron and steel remanufacturing industries, often makes impossible the return of the specific industry in which the employees of a given establishment work, and hence renders impossible their exact classification according to industry. Notwithstanding these difficulties, it is believed that a large proportion of the workers in the steel industry have been properly classified; and, since they work under such peculiar conditions, it was thought best to report them separately.

Paper box and wooden box factory employees.—The number of cases in which the enumerators failed to distinguish the operatives in paper box factories from the operatives in wooden box factories amounted to approximately one-third of the total. There is, therefore, a very large percentage of error in the statistics of occupations reported for each of these two industries.

Paper mill and pulp mill employees.—The enumerators failed to distinguish between paper mills and pulp mills so generally that no attempt has been made to report separate statistics for the occupations in each of these two industries.

Not specified mine employees.—Some of the enumerators, in returning the occupations of mine employees, neglected to state the kind of mine, as copper, iron, gold, etc. In a district in which only one mineral

is mined such returns could be classified under the proper industry, but in a district in which two or more minerals are mined it was necessary to classify them under "Not specified mines." In returning the occupations of the employees of those mines from which two or more minerals are extracted in about equal proportions, as copper and silver, silver and lead, the enumerators could not specify a particular kind of mine. It was necessary, therefore, to classify these returns also under "Not specified mines." From the foregoing it is evident that the 31,712 returns of workers of all kinds classified under "Not specified mines" did not come from the different mining states in the same proportions as the total number of mine workers returned, but in the main came from those states in which two or more minerals are mined in close proximity, or in which two or more minerals are extracted from the same mine. These, in general, are the mining states west of the Mississippi River and Michigan.

Occupations in not specified industries.—In those cases in which enumerators returned occupations without stating in what industries they were pursued, it was impossible to classify the returns under any specified industry. In case of mining occupations, metalworking occupations, and textile-mill occupations usually it was possible to determine to what group of related industries the different returns belonged, and in such cases they were classified, respectively, under "Not specified mines," "Not specified metal industries," and "Not specified textile mills." But in many of the cases it was possible to determine only that the occupations were pursued in manufacturing industries. These were classified under "Other not specified industries." In still other cases it was impossible to determine anything in regard to the industries in which the occupations were pursued. These were classified under "Occupations in not specified industries and service groups."

Specified occupations returned under trade names .-In all those cases in which hand trades, through the introduction of machinery, the multiplication of processes, and the division of labor, have rather recently developed into factory industries, there was a marked tendency for the operatives to give the old trade names as their occupations, rather than the names of the specific processes they were performing. In some industries a large percentage of the operatives were returned under these trade designations. This was especially true in bakeries, candy factories, cigar factories, harness factories, hat factories, jewelry factories, shoe factories, and clothing factories. As a result, the number of bakers, candy makers, cigar makers, harness makers, hatters, jewelers (factory), shoemakers (factory), and tailors and tailoresses is excessive. Sometimes the proprietors in such industries were returned under the old trade designations, as brewers,

¹ See Table VI, p. 302.

millers, tanners, etc.; but usually these returns could be properly classified, since the persons were returned as *employers*.

TRADE AND TRANSPORTATION.

Clerks in stores and salesmen.—Although instructed specifically to the contrary, many of the Thirteenth Census enumerators failed utterly—as did the enumerators at preceding censuses—to distinguish between the clerks and the salesmen employed in wholesale and retail trade. The tendency was to return salesmen as clerks, although their duties were in no sense clerical. As a result, the statistics reporting the number in each of these occupations, respectively, are far from accurate. This is indicated by the fact that the number of salesmen and saleswomen reported is less than three-fourths the number of wholesale and retail merchants and dealers, and by the further fact that there are reported more than two clerks in stores for each five salesmen and saleswomen. Similar figures were reported at the Twelfth Census.

Locomotive engineers and firemen.—The enumerators did not always distinguish carefully between locomotive engineers and the stationary engineers employed by railroads, or between locomotive firemen and the other firemen employed by railroads; and the large number of locomotive engineers and of locomotive firemen reported for 1910 indicates that, even after such corrections as could be made, some stationary engineers are included with the locomotive engineers and some other firemen are included with the locomotive firemen.

Railroad brakemen.—The number of railroad brakemen is entirely too small as compared with the number of locomotive engineers and firemen. This probably is due to the return of brakemen under certain general designations.

Steam and street railroad employees.—The enumerators in their returns did not always specify the employees of street railways as such, and it is probable, therefore, that some of these were classified with and have been reported as employees of steam railroads. However, it is not believed that the number of such cases is large enough to affect the statistics perceptibly.

DOMESTIC AND PERSONAL SERVICE.

Cooks and general servants.—In the occupation returns, especially the returns for the colored females of the South, there was not a careful distinction made between cooks and general servants. As a result, in some areas the female cooks far outnumbered the general servants, and in the United States as a whole there was more than one female cook to each three female general servants. The returns for the male cooks and servants were much better than for the females.

Housekeepers and stewards.—Notwithstanding the fact that the enumerators were given specific instruc-

tions to return as housekeepers only those women who were keeping house for salaries or wages, so many of them returned as housekeepers housewives doing housework in their own homes, without salaries or wages, and servants who were in no sense housekeepers, that, after a rigid exclusion of the most improbable cases, it is certain that so many housewives and servants are included under the head of housekeepers as to render the statistics very inaccurate. At the census of 1910, as at the preceding, there were reported more housekeepers and stewards than waiters, and more than one housekeeper or steward to each ten general servants.

Nurses.—An effort was made to separate the trained nurses from the practical or untrained nurses, and to exclude from both groups nursemaids and children's nurses. It is believed, however, that a considerable number of nursemaids and children's nurses were included with the other nurses; and the effort to classify separately the trained and the practical nurses was not very successful. Therefore, the enormous increase from 1900 to 1910 in the number of trained nurses may be in part apparent only.

OTHER CLASSES.

Inmates of institutions.—At the Twelfth Census only such of the inmates of institutions—asylums, homes, hospitals, jails, penitentiaries, etc.—as were actually engaged in remunerative work for which they received stated wages in addition to their board were returned as gainfully occupied. At the Thirteenth Census all inmates of such institutions who were regularly employed, whether at productive labor or at other duties, such as cooking, scrubbing, laundry work, etc., were returned as gainfully occupied. The inclusion, in 1910, of all the gainfully occupied inmates of institutions, as against the inclusion, in 1900, of only those inmates who received wages in addition to their board, has contributed many thousands to the number of persons reported as gainfully occupied in the United States. In returning occupations for the inmates of institutions, some of the enumerators returned former occupations and not the ones being pursued in the institutions. This fact made it difficult to classify these returns properly.

Peculiar occupations for women.—The Thirtcenth Census enumerators, like the enumerators at previous censuses, returned women as following many occupations which are very peculiar and unusual for women.

¹ There are no available Federal statistics from which can be made even an approximate estimate of the total number of inmates in institutions engaged in gainful occupations. A rough estimate, based on the most recent Federal statistics showing the number of prisoners and juvenile delinquents and the proportion of them gainfully occupied, indicates that probably from 80,000 to 90,000 such persons were engaged in gainful occupations in 1910. The number of inmates of charitable institutions, almshouses, insane asylums, and asylums for the feeble-minded who were engaged in gainful occupations probably was sufficient to bring the total number of inmates of institutions engaged in gainful occupations at the date of the Thirteenth Census up to or above 100,000.

A careful examination of the schedules in such cases usually showed that errors had been made in the return, either of the sex or of the occupation. Most of these errors were found and corrected by the classifying clerks. Others were corrected during the work of final revision. Occasionally, however, no such errors were apparent on the schedules. These cases are reported, although it is probable that in most instances the women did not actually follow the occupations returned for them. The following are examples of such occupations:

Blacksmiths.
Brick and stone masons.
Elevator tenders.
Furnacemen and smeltermen.
Heaters (metal).
Longshoremen and stevedores.
Machinists.
Rollers and roll hands (metal).
Sailors and deck hands.
Tinsmiths.

Soldiers, sailors, and marines.—An effort was made to classify separately each of the special occupations followed by the enlisted men of the army and the navy, as blacksmith, teamster, fireman, machinist, etc.; but so many of the enumerators had failed to make such distinctions that this effort was not successful. Therefore, the enlisted men of the army and the navy are reported only as soldiers, sailors, and marines.

Two occupations for same person.—The enumerators were instructed that in case a person had two occupations they should return only the more important one—that is, the one from which the person got the more money. In case an enumerator did return two occupations for the same person, it was the rule of the office to consider only the first-named occupation.

Women musicians and teachers of music.—Of the large number of women classed as musicians or teachers of music, it is probable that many did not spend a large proportion of their time at the occupation.

PRESENTATION.

Scope of report.—In a country where the occupations are so numerous as in the United States, it is impossible to present, in a single volume of moderate size, all the occupation statistics for which statisticians and others may have need. The original plans for the occupation report contemplated such a selection of occupation tables that the chief statistical facts in connection with occupations would be shown, in one table or another, and in such form that the statistical facts of less importance could be derived from them easily. But this plan could not be carried out. In the first place, because of a lack of funds, the work on occupations was practically stopped for an entire year during the regular census period. When it was again resumed and the first and simpler of the two contemplated machine counts of the occupation cards was almost completed, it was decided that, since the Thirteenth Census period had elapsed and since regular annual reports and other work of the intercensal period were being greatly delayed by the employment of the census clerks upon the Thirteenth Census work, it was best to abandon the second machine count of the occupation cards and to limit the scope of the occupation report to the tables which could be constructed from the results of the first count of the cards.1

The limitation of the scope of the present report to the results of the first count of occupations has made necessary the omission of contemplated statistics on

¹ This decision was made in compliance with the recommendations of a special advisory committee on the work of the census. The members of this committee were Hon. S. N. D. North and Hon. William R. Merriam, former Directors of the Census; Prof. Walter F. Willcox, of Cornell University; Mr. W. S. Rossiter, formerly Chief Clerk of the Census; and Hon. Daniel C. Roper, First Assistant Postmaster General, and formerly an official of the Census Bureau.

the following subjects: Unemployment, marital condition of persons engaged in gainful occupations, countries of birth of foreign-born gainful workers, age distribution of gainful workers by five or ten year periods, and class of worker—that is, whether the worker was an employer, an employee, or was working on his own account. Statistics on each of these subjects will be presented in a special report on occupations to be published later.

Description of general tables.—The present report, under the above plan, contains 9 general tables, as follows:

Table I (p. 91) shows, for the United States, the number and sex of the persons 10 years of age and over engaged in 1910 in each of 428 specified occupations and occupation groups, representing combinations of the elementary occupations shown in Table VI. Similar statistics are presented for each state and for the District of Columbia in Table II (p. 96) and for each city of 100,000 inhabitants or more in Table III (p. 152).

Table IV (p. 208) shows, for each city of 25,000 to 100,000 inhabitants, the number of males and females 10 years of age and over engaged in 1910 in each of 215 specified occupations and occupation groups. In this table the 215 main occupations and occupation groups of Table I are shown without subdivision.

Table V (p. 292) shows, for each of the outlying territories of Alaska, Hawaii, and Porto Rico, and also separately for the cities of Honolulu, in Hawaii, and Caguas, Mayaguez, Ponce, and San Juan, in Porto Rico, the number and sex of the persons 10 years of age and over engaged in each important occupation and occupation group in 1910. In the table for each separate area, the 215 occupations and occupation groups of Table I are shown so far as they were appli-

NUMBER OF PERSONS ENGAGED IN GAINFUL OCCUPATIONS COMPARED WITH THE POPULATION 10 YEARS OF AGE AND OVER, BY DIVISIONS AND STATES: 1880-1910.

¹ Figures for 1890 are exclusive of persons in Indian Territory and on Indian reservations, areas specially enumerated at that census, but for which occupation statistics are not available.
² Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.

³ Includes population of Indian Territory.

operatives in candy factories, etc. These residuary groups, while not strictly occupational, have a great deal of occupational significance; for, although each of them is made up of the workers in numerous occupations pursued, sometimes, in several different industries, these workers together form a group which, in many respects, is occupationally homogeneous. Since the proprietors, the officials, the supervisory persons, the clerical workers, the followers of trades, and the laborers are otherwise classified, all the persons included in each of the residuary groups shown under "Manufacturing and mechanical industries," are factory operatives belonging to the semiskilled class. In each extractive industry the nature of the returns were

such that it was deemed best to combine the laborers and the semiskilled workers.

Thus, so far as practicable, the combination of the elementary occupations of Table VI has been along occupational rather than industrial lines. Each occupation of the condensed list is classified in that part of the industrial field in which it is most commonly pursued. For example, blacksmiths, carpenters, electricians, and machinists have been classified under "Manufacturing and mechanical industries," although each of these trades is pursued in almost every industry. Clerical occupations, which can hardly be said to be more common to one general division of occupations than to another, have been classified apart.

CHAPTER II.

SUMMARY AND ANALYSIS OF RESULTS.

SUFFICIENCY OF THE OCCUPATION RETURNS.

The comparisons and discussions of this chapter are confined to the results of the censuses of 1880, 1890, 1900, and 1910. In 1880, 1890, and 1900 the occupation returns had reference only to gainfully occupied persons 10 years of age and over. In 1910 the enumerators were instructed to include all persons gainfully occupied, irrespective of age, but the returns for persons under 10 years of age are not covered by the statistics presented in this volume. At each of these censuses, then, the occupation statistics refer only to gainfully occupied persons 10 years of age and over. Before comparing the statistics of 1910 with those of preceding censuses, it is essential to establish, as nearly as possible, the relative sufficiency of the occupation returns.

Possible excess in the number of women returned as gainful workers in 1910.—In continental United States the whole number of males 10 years of age and over reported as engaged in gainful occupations in 1910 (see Table 2, p. 30) was 30,091,564, representing 81.3 per cent of all males of that age, as compared with 80 per cent in 1900, 79.3 per cent in 1890, and 78.7 per cent in 1880. These percentages show that the proportion of males 10 years of age and over engaged in gainful occupations increased gradually during the three decades, 1880-1910, with the rate of increase somewhat greater between 1900 and 1910 than during either of the two preceding decades. There were 8,075,772 females 10 years of age and over reported as gainfully occupied in 1910, representing 23.4 per cent of all females of that age, as compared with 18.8 per cent in 1900, 17.4 per cent in 1890, and 14.7 per cent in 1880. The great increase from 1900 to 1910 in the proportion of females, as compared with the moderate increase from 1880 to 1900, and as compared with the moderate increase from 1900 to 1910 in the proportion of males gainfully occupied, calls for further examination.

Table 1 shows, for the United States, for each geographic division, and for each state, the proportion of males and of females 10 years of age and over engaged in gainful occupations at each of the last four censuses, 1910, 1900, 1890, and 1880.

The percentages for the different states, as given in Table 1, show that the marked increase from 1900 to

1910 in the proportion of females 10 years of age and over engaged in gainful occupations was general throughout the United States, though more marked in the South Atlantic, the East South Central, and the West South Central divisions than in the other geographic divisions. A part of this great increase probably was due to a difference in the basis of enumeration at the two censuses. The following two paragraphs from the "Instructions to Enumerators" at the Thirteenth Census may have resulted in the enumerators returning occupations for women who would not have been considered gainful workers by the Twelfth Census enumerators, working under different instructions:

144. Column 18. Trade or profession.—An entry should be made in this column for every person enumerated. The occupation, if any, followed by a child, of any age, or by a woman is just as important, for census purposes, as the occupation followed by a man. Therefore it must never be taken for granted, without inquiry, that a woman, or child, has no occupation.

154. Women doing farm work.-A woman working regularly at outdoor farm work, even though she works on the home farm for her husband, son, or other relative and does not receive money wages, should be returned in column 18 as a farm laborer. Distinguish, however, such women who work on the home farm from those who work away from home, by writing in column 19 either home farm or working out, as the case may require. Of course, a woman who herself operates or runs a farm should be reported as a farmer, and not as a farm laborer.

The latter paragraph may have had much to do with the enormous increase between 1900 and 1910 in the number of females returned as engaged in agricultural pursuits, an increase from 977,336 in 1900 to 1,807,050 (see Table 15, p. 54) in 1910, or nearly 85 per cent. The increase in the number of female agricultural laborers was especially great—from 663,209 in 1900 to 1,522,133 in 1910, or 129.5 per cent, as compared with an increase of only 23.3 per cent from 1890 to 1900. Numerically, most of this great increase in the number of female agricultural laborers was confined to farm laborers, and mainly to farm laborers working on the home farm. The whole number of female farm laborers1 in 1910 was 1,514,107, as against 661,103 in 1900, an increase of 129 per cent. Between 1900 and 1910 the number of female farm laborers working on the home farm increased from 441,055 to 1,176,585, or 166.8 per cent, while the number of female farm laborers working out increased from 220,048 to 337,522, or 53.4 per cent. That too many women were returned as farm laborers at the Thirteenth Census is further evidenced by the fact that the percentage which women constituted of all farm laborers rose from 15.1 in 1900 to 25.3 in 1910. It is hardly probable that in the United States, in 1910, more than one farm laborer in every four was a woman.2 And this reported increase from 1900 to 1910 of 129.1 per cent in the number of female farm laborers appears less reliable, since there was no similar increase in the

The great percentage increase from 1900 to 1910 in female agricultural laborers was not confined to children. In fact, the percentage increase was greater for females 16 years and over than for females 10 to 15 years of age, the respective percentages being 144.3 and 98.2. Neither was the percentage increase confined largely or mainly to negro female agricultural laborers, for while the percentage increase for all female agricultural laborers was 129.5, that for negro female agricultural laborers was only 90.5. Furthermore, the great percentage increase in female farm laborers, 129.1 per cent, was not confined principally to the South. In fact, the rate of increase was far smaller in the South than in other parts of the country. For example, in 12 leading agricultural states of the South the percentage increase from 1900 to 1910 in female farm laborers was 120.7, while in 12 leading agricultural states outside of the South the percentage increase was 300.9.3 In the selected southern agricultural states the increase in female farm laborers ranged from 31.9 per cent in Louisiana to 317.6 per cent in Texas and to 357.1 per cent in Kentucky; and in the selected agricultural states outside the South the increase ranged from 154.9 per cent in Kansas to 471.4 per cent in Wisconsin and to 527 per cent in North Dakota.

These percentage increases are useful mainly, however, to show that the great increase from 1900 to 1910 in female farm laborers was general throughout the United States and was not confined to children or to negroes. Numerically, however, it is a fact that a large proportion of this increase was confined to the South, to the negroes, and to children 10 to 15 years of age.

number of male farm laborers, or in the number of farmers. From 1900 to 1910 there was an increase of but 20.4 per cent in the number of male farm laborers, while the increase in the number of farmers was but 4.9 per cent.

² In Alabama, Georgia, Mississippi, and South Carolina, in 1910, the number of female farm laborers working on the home farm outnumbered the males (see Tables II and VII, pp. 96 and 434); and in Alabama, Mississippi, and South Carolina, the excess of females over males was so great that there was actually an excess of females over males in the total number of farm laborers. over males in the total number of farm laborers. Also, in Arkansas, Florida, Louisiana, North Carolina, and Texas, the number of female farm laborers on the home farm approached the number of males rather closely. In each of these nine states the number of male farm laborers on the home farm exceeded the females in each of the three lowest age periods—10 to 13, 14 to 15, and 16 to 20—but in each of the two highest age periods—21 to 44, and 45 years and over—the female farm laborers on the home farm greatly outnumbered the males in each state. In each of these nine states, too, the number of negro female farm laborers on the home farm greatly exceeded the number of males. The figures indicate that a large proportion of the adult negro males working on the home farm were returned as "farmers," while most of the adult negro females working on the home farm were returned as "farm laborers."

³The selected southern agricultural states are: Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia. The selected agricultural states outside of the South are: California, Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin:

¹ Exclusive of turpentine farm laborers.

The great numerical increase from 1900 to 1910 in female agricultural laborers was mainly in female farm laborers, the number of which increased 853,004. Of this increase, 90.2 per cent was in the 12 selected agricultural states of the South referred to on the preceding page, and almost 80 per cent was in 7 southern agricultural states—Alabama, Arkansas, Georgia, Mississippi, North Carolina, South Carolina, and Texas. From 1900 to 1910 the number of all female agricultural laborers increased 858,924, and the number of negro female agricultural laborers increased 461,018. Thus 53.7 per cent of the increase in the total number was confined to negro females. Furthermore, there was an increase from 1900 to 1910 of 202,839 in the number of female agricultural laborers 10 to 15 years of age, which was 23.6 per cent of the total increase in the number of female agricultural laborers. Of this increase of 202,839 in the number of female agricultural laborers 10 to 15 years of age, 91.5 per cent was confined to the 12 selected southern agricultural states and 81.6 per cent to 7 southern agricultural states-Arkansas, Georgia, Mississippi, North Alabama. Carolina, South Carolina, and Texas.

There is no doubt that between the Twelfth Census and the Thirteenth Census there was a great increase in the proportion of women 10 years of age and over actually engaged in gainful occupations, and it is quite probable that the proportion increased more rapidly during this decade than during any preceding decade; but the above analysis indicates that a part of the great increase reported for the decade 1900 to 1910 was apparent only and was due to a difference in the instructions to enumerators at the two censuses, rather than to so marked an increase in the proportion of women actually engaged in gainful labor. This analysis indicates further that, while the number of women returned as engaged in agricultural pursuits was affected most by these differences in the instructions to the enumerators, the number of women returned as engaged in other pursuits probably was affected by them to some extent.

It is impossible, of course, to measure exactly the extent to which the number of females returned as engaged in gainful occupations in 1910 probably was increased by the changes in the instructions to enumerators, referred to above. But if, for the moment, it be assumed that outside of agricultural pursuits the returns were not affected perceptibly, it may be possible to approximate roughly any excess in the number of females returned as engaged in agricultural pursuits. The small increase from 1900 to 1910 in the number of males engaged in agricultural pursuits, 14.4 per cent, and in the number of farms, 10.9 per cent, suggests that probably there was no great increase during this period in the number of females

engaged in agricultural pursuits, and, hence, probably no marked increase in the proportion which females engaged in agricultural pursuits constituted of all gainfully occupied females. An examination of the proportion which females engaged in agricultural pursuits constituted of all gainfully occupied females at each of the censuses 1880, 1890, and 1900 lends strength to this suggestion. In 1880 females engaged in agricultural pursuits constituted 22.5 per cent of all gainfully occupied females; in 1890 this proportion had fallen to 19.2 per cent, and, in 1900, to 18.4 per cent. If the decrease in the proportion of gainfully occupied females engaged in agricultural pursuits was the same from 1900 to 1910 as it was from 1890 to 1900, then only 17.6 per cent of all gainfully occupied females in 1910 were actually engaged in agricultural pursuits. According to this estimate, the number of females engaged in agricultural pursuits in 1910 would have been 1,338,950 instead of 1,807,050, as reported, and the total number of females gainfully occupied in 1910 would have been 7,607,672 instead of 8,075,772, as reported. Also, according to this estimate, the proportion of all females gainfully occupied in 1910 would have been 17 per cent instead of 18.1 per cent, as reported; and the proportion of females 10 years of age and over engaged in gainful occupations in 1910 would have been 22 per cent instead of 23.4 per cent, as reported. Furthermore, the proportion of gainful workers in the total population would have been 41 per cent instead of 41.5 per cent, as reported, and the proportion of gainful workers in the population 10 years of age and over would have been 52.7 per cent instead of 53.3 per cent, as reported.

While the above is but a rough approximation, the analysis indicates strongly that a reduction of 468,100 in the number of females returned as engaged in agricultural pursuits would not be excessive. At least, it is very probable that a reduction of 468,100 in the total number of females engaged in all occupations would not be excessive, and, hence, that not over 17 per cent of all females and not over 22 per cent of the females 10 years of age and over were engaged in gainful occupations in 1910. Even these reduced proportions would show a considerably greater increase from 1900 to 1910 than during either of the two preceding decades, both in the proportion of all females and in the proportion of females 10 years of age and over engaged in gainful occupations.

Possible excess in the number of children returned as engaged in agricultural pursuits in 1910.—The number of children of both sexes 10 to 15 years of age engaged in all agricultural pursuits 1 increased from 1,061,971 in 1900 to 1,431,254 in 1910—an increase of 34.8 per cent. The males increased from 854,690

¹ See Table 29, p. 70.

to 1,021,084, or 19.5 per cent, while the females increased from 207,281 to 410,170, or 97.9 per cent. The number of agricultural laborers 10 to 15 years of age increased from 1,054,446 in 1900 to 1,421,899 in 1910—an increase of 34.8 per cent. The males increased from 847,642 to 1,012,256, or 19.4 per cent; while the females increased from 206,804 to 409,643. or 98.1 per cent. This great increase in the number of children engaged in agricultural pursuits, especially in the number of female agricultural laborers, seems excessive. That it is excessive is indicated by the fact that from 1900 to 1910 there was no similar increase in the total number of persons engaged in agricultural pursuits, and by the further fact that, exclusive of agricultural pursuits, there was a marked decrease during this period in the total number of gainfully occupied children 10 to 15 years of age, a decrease of 18.8 per cent for both sexes, 19 per cent for males, and 18.5 per cent for females. The great increase in the number of children engaged in agricultural pursuits may be due in part to the following instruction to the Thirteenth Census enumerators:

144. Column 18. Trade or profession.—An entry should be made in this column for every person enumerated. The occupation, if any, followed by a child, of any age, or by a woman is just as important, for census purposes, as the occupation followed by a man. Therefore it must never be taken for granted, without inquiry, that a woman, or child, has no occupation.

The effect, if any, of such an instruction upon the returns of the enumerators probably would be more marked in the case of children working at agricultural pursuits than in case of children working at other pursuits. Children who work at nonagricultural pursuits commonly work away from home and for wages, and, hence, probably their occupations were quite generally returned at previous censuses. In agriculture, a large proportion of the children work for their parents and without wages; and, since their work varies from doing a few errands or chores to field work regularly performed, the enumerator must of necessity draw the line between the gainful and the nongainful workers. The effect, if any, of the above instruction on this point probably was to cause him to include a larger proportion of the farm children among the gainful workers than otherwise he would have done. In addition, he was given the following special instruction in regard to the return of the occupations of children working on farms:

155. Children on farms.—In case of children who work for their own parents on a farm, the entry in column 18 should be farm laborer and in column 19 home farm; but for children who work as farm laborers for others, the entry in column 19 should be working out.

The instruction that occupations should not be returned for children working for their parents at chores, errands, or general household work was practically the same in 1900 and 1910. On the whole, however, it may be asserted that at the Thirteenth Census much

more emphasis was placed upon the instruction to return an occupation for every child gainfully occupied than was the case at the Twelfth Census. It may be, then, that during the decade 1900 to 1910 there was no marked increase in the number of children actually engaged in agricultural pursuits, and that the apparent increase was due mainly to the enumeration as gainful workers in 1910 of farm children doing chores or performing other light tasks not considered gainful occupations in 1900. It can not be asserted with assurance, however, that the Twelfth Census enumerators failed generally to enumerate as gainful workers farm children who should have been so enumerated, or that the Thirteenth Census enumerators generally enumerated as gainful workers farm children who should not have been so enumerated; but the evidence here presented indicates that the great increase from 1900 to 1910 in the number of children returned as engaged in agricultural pursuits was due to a difference in the basis of enumeration at the two censuses, rather than to any actual increase in the number at work.

In 1910, 99.1 per cent of the males, 99.9 per cent of the females, and 99.3 per cent of all children 10 to 15 years of age engaged in agricultural pursuits were agricultural laborers. As shown in the first paragraph on this page, the increase from 1900 to 1910 in the number of agricultural laborers 10 to 15 years of age was 19.4 per cent for the males and 98.1 per cent for the females. Thus, the great percentage increase from 1900 to 1910 in the number of children 10 to 15 years of age engaged in agricultural pursuits was confined mainly to female agricultural laborers, the number of which increased 202,839. As stated in the first paragraph on page 28, 91.5 per cent of this increase of 202,839 was in 12 selected agricultural states of the South; and 81.6 per cent of it was in seven agricultural states of the South—Alabama, Arkansas, Georgia, Mississippi, North Carolina, South Carolina, and Texas. However, the percentage increase in female agricultural laborers 10 to 15 years of age, as distinguished from the numerical increase, was far less in the 12 selected agricultural states of the South than in the remaining states, the respective percentages being 93.1 and 234.3. In the 12 selected agricultural states of the South the percentage increase from 1900 to 1910 in female agricultural laborers 10 to 15 years of age varied from 2.9 per cent in Louisiana to 233.5 per cent in Kentucky and to 284.9 per cent in Texas. For the male agricultural laborers 10 to 15 years of age, the percentage increase from 1900 to 1910 was considerably greater in the 12 selected agricultural states of the South than in the remaining states, the respective percentages being 26.5 and 4.1. In the 12 selected southern states the increase varied from three-tenths of 1 per cent in Louisiana to 62.2 per cent in Texas.

NUMBER AND PROPORTION OF PERSONS OCCUPIED.

United States.—At the Thirteenth Census, in 1910, there were 38,756,223 persons 10 years of age and over engaged in gainful occupations in the United States, including Alaska, Hawaii, Porto Rico, and the military and naval stations abroad. The gainful workers thus formed 41.5 per cent of the total population enumerated at that census. In this report, as in other Thirteenth Census reports, the term "United States" when used without qualification embraces the 48 states and the District of Columbia but not the outlying territories and possessions of the United States. Sometimes, however, the United States in this sense is referred to as the United States proper, or as continental United States.

In continental United States the gainful workers numbered 38,167,336, which was 41.5 per cent of the total population and 53.3 per cent of the population 10 years of age and over. In the male population the gainful workers numbered 30,091,564, which was 63.6 per cent of all males and 81.3 per cent of the males 10 years of age and over. In the female population the gainful workers numbered 8,075,772, which was 18.1 per cent of all females and 23.4 per cent of the females 10 years of age and over. Thus, in the total population, over two-fifths of all persons, considerably over three-fifths of all the males, but considerably less than one-fifth of all the females, were engaged in gainful occupations in 1910; and in the population 10 years of age and over, more than one-half of all persons, over four-fifths of the males, but less than one-fourth of the females, were gainfully occupied. In other words, of all persons 10 years of age and over in 1910, more than every other one had a gainful occupation, of the males over four out of five were gainful workers, and of the females almost one out of four was a gainful worker.

In Table 2 the number of persons engaged in gainful occupations is compared with the total population and with the population 10 years of age and over, for both sexes and for each sex separately, at the censuses of 1910, 1900, 1890, and 1880, respectively.

This table shows that the proportion of the total population engaged in gainful occupations increased gradually from 34.7 per cent in 1880 to 41.5 per cent in 1910, the increase being least rapid from 1890 to 1900 and most rapid from 1900 to 1910. Of the male population the proportion engaged in gainful occupations increased from 57.8 per cent in 1880 to 63.6 per cent in 1910, while of the female population the proportion increased during the same period from 10.7 to 18.1 per cent. The increase for each sex was least rapid from 1890 to 1900. For the females it was most rapid from 1900 to 1910, but for males it was at the same rate from 1880 to 1890 as from 1900 to 1910.

The proportion of the population 10 years of age and over engaged in gainful occupations increased from 47.3 per cent in 1880 to 53.3 per cent in 1910,

the increase being least rapid from 1890 to 1900 and most rapid from 1900 to 1910. In the male population 10 years of age and over the proportion gainfully occupied increased gradually from 78.7 per cent in 1880 to 81.3 per cent in 1910, while that of gainful workers in the female population 10 years of age and over increased from 14.7 to 23.4 per cent. The increase for males was considerably greater from 1900 to 1910 than for either of the two preceding decades, while for females it was much less rapid from 1890 to 1900 than during the preceding decade, but was quite marked from 1900 to 1910. After making full allowance for a possible excess in the number of females reported at work in 1910, the increase in the proportion of females 10 years of age and over engaged in gainful occupations appears to have been much greater during the decade 1900 to 1910 than during either of the two preceding decades.

¹ Figures for 1890 are exclusive of persons in Indian Territory and on Indian reservations, areas specially enumerated at that census, but for which occupation statistics are not available.

² Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.

Divisions and states.—The number of persons engaged in gainful occupations is compared with the total population, by geographic divisions and by states, for 1910, 1900, 1890, and 1880, in Table 3 (p. 34).

Table 3 shows that in 1910 persons 10 years of age and over engaged in gainful occupations formed 41.5 per cent of the total population of the United States, and that in the different geographic divisions the proportion of gainful workers in the population varied from 38.2 per cent in the West North Central to 46.1 per cent in the Pacific division. In the East North Central, the West North Central, and the West South Central divisions the proportion gainfully occupied was smaller than in the United States as a whole, while in each of the other geographic divisions the

proportion was larger than in the United States as a whole. In each geographic division, however, the proportion of the population engaged in gainful occupations was greater in 1910 than in 1900, the increase being much larger in the southern section of the United States—that part included in the South Atlantic, the East South Central, and the West South Central divisions—than in the northern and western sections. New England showed the smallest increase in the proportion gainfully occupied—from 42.5 per cent in 1900 to 44.5 per cent in 1910—and the East South Central division the largest increase—from 38.3 per cent in 1900 to 42.8 per cent in 1910.

In the states the proportion of the total population engaged in gainful occupations in 1910 varied from 35.2 per cent in Utah to 54.9 per cent in Nevada. The states having the smallest proportions were Utah, 35.2 per cent; Oklahoma, 36.1 per cent; Kansas and West Virginia, each 36.7 per cent; Nebraska, 37 per cent; and Iowa and New Mexico, each 37.1 per cent. The states having the largest proportions were Nevada, 54.9 per cent; Wyoming, 50.4 per cent; Mississippi, 48.9 per cent; and South Carolina, 48.1 per cent. In every state except Arizona a larger proportion of the total population was gainfully occupied in 1910 than in 1900. The greatest increases were in Arkansas, Georgia, Mississippi, Nevada, North Carolina, South Carolina, and Texas, in each of which states the gainful workers constituted over 5 per cent more of the population in 1910 than in 1900.

In Table 4 (p. 35) the number of persons engaged in gainful occupations is compared with the population 10 years of age and over, by geographic divisions and by states, for 1910, 1900, 1890, and 1880.

Table 4 shows that, while in the United States as a whole 53.3 per cent of all persons 10 years of age and over in 1910 were engaged in gainful occupations, in the geographic divisions this proportion varied from 48.9 per cent in the West North Central to 58.3 per cent in the East South Central division. In each division the proportion was higher in 1910 than in 1900, the increase being greatest in the South Atlantic and East South Central divisions and smallest in the West North Central and Mountain divisions.

In the states, the proportion of the population 10 years of age and over engaged in gainful occupations in 1910 ranged from 46.9 per cent in Iowa to 68 per cent in Mississippi. The states having the smallest proportions were Iowa, 46.9 per cent; Kansas, 47 per cent; Nebraska, 47.7 per cent; Utah, 47.9 per cent; and Indiana, 48 per cent. The states having the largest proportions were North Carolina, 60 per cent; Georgia, 61.5 per cent; Wyoming, 62.6 per cent; Nevada, 64.3 per cent; Alabama, 64.7 per cent; South Carolina, 67.6 per cent; and Mississippi, 68 per cent. Except in three states—Arizona, Montana,

and North Dakota—there was an increase from 1900 to 1910 in the proportion of the population 10 years of age and over engaged in gainful occupations. The states showing the largest increases were Alabama, Arkansas, Georgia, Mississippi, Nevada, North Carolina, South Carolina, and Texas. In each of these states the gainful workers constituted over 6 per cent more of the population 10 years of age and over in 1910 than they did in 1900.

Differences in the proportion of the population engaged in gainful occupations usually result from differences either in the sex or the age composition of the population, in the proportion of foreign born or of negroes in the population, in the proportion of the population living in urban areas, or in the industrial activities of the people. In the states, the proportion of gainful workers in the population usually is larger for males than for females, for adults than for children, for negroes than for white people, for the foreign-born white than for the native white people, for urban than for rural dwellers, and for manufacturing and trading than for agricultural communities. In the discussion of Table 5 (p. 36), which shows for each geographic division and for each state the proportion of the males 10 years of age and over engaged in gainful occupations in 1910, and in the discussion of Table 6 (p. 37), which shows similar figures for females, marked differences in proportions are pointed out and the most probable causes for them are given.

The proportion of gainful workers in the population 10 years of age and over is shown graphically, for each state in the United States, for both sexes in 1910 and 1900 and for males and females in 1910, in the diagrams on page 38.

Table 5 shows that in the United States in 1910 more than eight out of every ten, 81.3 per cent, of the males 10 years of age and over were engaged in gainful occupations. The proportion was 78.2 per cent in the West North Central division, 79.4 per cent in the East North Central division, and over 80 per cent in each of the other geographic divisions. In each of the geographic divisions the proportion was larger in 1910 than in 1900, the increase being most marked in the South Atlantic, the East South Central, and the West South Central divisions.

A smaller proportion of males 10 years of age and over engaged in gainful occupations in 1910 in Vermont and Maine than in the other New England states probably was due largely to the fact that in these two states manufacturing was less extensive, the proportion of foreign born in the male population 10 years of age and over was smaller, and the proportion of the male population living in cities was smaller than was the case in the other New England states.

In each of the three states of the Middle Atlantic division more than eight out of every ten males 10 years

of age and over were gainfully occupied in 1910, the proportion in each state being practically the same as in the United States. In New Jersey the proportion was slightly smaller, and in New York and Pennsylvania slightly larger, than in 1900.

In the states comprising the East North Central and the West North Central divisions the proportion of the males 10 years of age and over engaged in gainful occupations in 1910 varied from 76.1 per cent in Iowa to 80.7 in Missouri. In the entire area, and in each of the states which comprise it, the proportion was smaller than in the United States, and the proportion for the area was also smaller than that for any of the other geographic divisions. This is largely an agricultural area. In 1910 a much smaller proportion of the population lived in cities, and the proportion of foreign born in the population was smaller than in the New England and Middle Atlantic divisions; the negro population, in which the proportion of gainful workers is larger than in the white population, was small in this area as compared with the area comprised in the South Atlantic, the East South Central, and the West South Central divisions; and boys 10 to 19 years of age, many of whom do not work, formed a larger proportion of the male population in this area than in the Mountain and the Pacific divisions. These facts account for the smaller proportion of gainful workers in the male population 10 years of age and over.

In the South—comprising the South Atlantic, the East South Central, and the West South Central divisions-considerably more than four-fifths of all the males 10 years of age and over were engaged in gainful occupations in 1910, the proportion varying from 79.6 per cent in the District of Columbia to 88.3 per cent in Alabama, where it was larger than in any other state of the Union. In the main, this is an agricultural area. In 1910 only a few of the states had important manufacturing industries, and the amount of trade was small in comparison with the size of the area. The population was largely rural and the proportion of foreign born was small. In general, then, the large proportion of gainful workers in the male population 10 years of age and over in this area, and in the different states which comprise it, must be attributed mainly to the large proportion of negroes in the male population. In 1910 the proportion of negroes was 33.1 per cent in the South Atlantic division, 31 per cent in the East South Central division, 21.9 per cent in the West South Central division, and 29.1 per cent in the entire area.

The high proportion of gainful workers in the male population 10 years of age and over in Montana, Wyoming, and Nevada, as compared with the proportion in the other states of the Mountain division, and with the proportion in the United States, is accounted for in part by the small proportion of boys 10 to 19

years of age in the male population in each of these three states. This proportion was exceptionally small in Nevada—10.4 per cent, as contrasted with 19.3 per cent in the entire United States. In Wyoming the proportion of old men also was very small; and in Montana the proportion of foreign born in the male population 10 years of age and over was larger than in any other state in this division. In 1890, 1900, and 1910, the proportion of gainful workers in the male population 10 years of age and over was smaller in Utah than in any other state of the Mountain division. In 1900 and in 1910 boys 10 to 19 years of age formed a larger proportion of the male population in Utah than in any other state of this division; and, both in 1900 and in 1910, the proportion of boys 10 to 19 years of age engaged in gainful occupations was smaller in Utah than in most of the other states of this division.

In each of the three states of the Pacific division—Washington, Oregon, and California—more than four out of five of the males 10 years of age and over were engaged in gainful occupations in 1910. This rather high proportion probably was due in part to the low proportion of boys 10 to 19 years of age in the male population.

Table 6 (p. 37) shows that in the United States in 1910, 23.4 per cent of the females 10 years of age and over were engaged in gainful occupations, and that in the different geographic divisions of the United States this proportion varied from 16.1 per cent in the West North Central and Mountain divisions to 30.7 per cent in the East South Central and to 31 per cent in the South Atlantic division. In each geographic division there was a marked increase in the proportion from 1900 to 1910, the increase being especially great in the South Atlantic, the East South Central, and the West South Central divisions.

According to Table 6, there are two sections of the United States in which the proportion of females 10 years of age and over engaged in gainful occupations in 1910 was large. The first includes the New England and Middle Atlantic divisions. This is the chief manufacturing and trading section of the United States and its transportation business is large. These activities furnish suitable employment to females. The proportion of female workers in this section is increased, also, by the presence of large numbers of foreign-born white women, among whom the proportion of gainful workers is larger than among the native white women. Girls 10 to 14 years of age, among whom the proportion of gainful workers usually is small, constituted a smaller proportion of the female population in these two divisions than in any other geographic division except the Pacific. Furthermore, a far larger proportion of the population is urban than in any other section of the United States, and, as already stated, the proportion of gainful workers, especially in the female sex, usually is larger in an urban than in a rural

population. The other section in which there is a large proportion of gainful workers in the female population 10 years of age and over includes the South Atlantic, the East South Central, and the West South Central divisions. This is the great agricultural district of the South, the region of the cotton plantation, and the home of the negro. Cotton manufacturing is also important here. The plantations furnish employment to the negro females, among whom the proportion of gainful workers is larger than among white females; and large numbers of the white females work in the fields and the factories. While it is true that in this section in 1910 girls 10 to 14 years of age formed a larger proportion of the female population than in any other part of the United States, it is also true that a much larger proportion of the girls 10 to 14 years of age were gainfully occupied than in any other section.

The low proportion of the females 10 years of age and over engaged in gainful occupations in 1910 in Vermont and in Maine, as compared with the proportion in the other New England states, was due mainly to differences in industries, in the proportion of foreign born in the female population, and in the proportion of the population living in urban areas.

In the three Middle Atlantic states the proportion of the females 10 years of age and over gainfully occupied in 1910 varied as did the importance of the industries of manufacture and trade, the proportion of foreign born in the female population, and the proportion of the population living in urban areas.

In the East North Central division the two extremes in the proportion of the females 10 years of age and over engaged in gainful occupations in 1910 are represented by Illinois and Indiana. The comparatively large proportion in Illinois was due mainly to the presence of Chicago, with its important manufacturing, trade, and transportation, and with a proportion of 33.4 per cent of foreign born in the female population. In part, however, it was due to the proportion of the population living in urban areas being larger than in any other state of the division. The comparatively small proportion in Indiana is accounted for in part by the low proportion of foreign born in the female population (4.7 per cent) and in part by the low proportion of the population living in urban areas (42.4 per cent).

In the West North Central division the small proportion of gainful workers in the female population 10 years of age and over in 1910 is accounted for by the fact that this is largely an agricultural area, with a population which is 66.7 per cent rural, with a small proportion of negroes in the female population, and with only a small proportion of the white women at work on the farms. The low proportion in Kansas, as contrasted with Minnesota, is largely explained by the fact that, in 1910, in Kansas only 29.2 per cent of the population was urban and only 6.7 per cent

of the female population was foreign born, while in Minnesota 41 per cent of the population was urban and 23 per cent of the female population was foreign born.

As previously stated, in the South—comprising the South Atlantic, the East South Central, and the West South Central divisions—the large proportion of the females 10 years of age and over engaged in gainful occupations in 1910 is accounted for mainly by the large proportion of negroes in the female population. And in the different Southern states the variation in the proportion of negroes in the female population accounts mainly for the great variation in the proportion of the females 10 years of age and over engaged in gainful occupations. For example, the proportion of negroes in the female population accounts mainly for the high proportion of the females 10 years of age and over gainfully occupied in Alabama, Mississippi, and South Carolina, and for the comparatively low proportion in Kentucky, Oklahoma, West Virginia, and Tennessee. The comparatively low proportion in Delaware and Maryland is accounted for in part by the low proportion of negroes in the female population and in part by the industries in these two states being somewhat different from those in the other southern states; while the high proportion in the District of Columbia is accounted for mainly by the extensive employment of women in the departments of the Federal Government.

The proportion of gainful workers in the female population 10 years of age and over in 1910 varied in the different states of the Mountain division from 12.3 per cent in Idaho to over 18 per cent in Colorado and Nevada. In Idaho the proportion is smaller than in any other state in the Union, due in part, no doubt, to the absence of large trading centers and important manufacturing industries and in part, possibly, to the economic well-being of the people. There was, too, in 1910 a rather high proportion of girls 10 to 14 years of age in the female population of Idaho; and the proportion of urban dwellers was less than half that for the United States. In each of the states of this division except Arizona there was an increase from 1900 to 1910 in the proportion of gainful workers in the female population 10 years of age and over. In Arizona the decrease from 18.3 per cent in 1900 to 16.8 per cent in 1910 was largely in the proportion of Indian females reported as gainful workers.

In the Pacific division the proportion of gainful workers in the female population 10 years of age and over in 1910 was considerably larger in California than in either Washington or Oregon. This probably was due in part to the commercial, industrial, and agricultural activities of the people being somewhat different in California and furnishing more suitable employment to females, and in part to the fact that in California a larger proportion of the population is urban than in either Washington or Oregon.

POPULATION.

NUMBER OF PERSONS ENGAGED IN GAINFUL OCCUPATIONS COMPARED WITH THE TOTAL POPULATION, BY DIVISIONS AND STATES: 1880-1910.

¹ Figures for 1890 are exclusive of persons in Indian Territory and on Indian reservations, areas specially enumerated at that census, but for which occupation statistics are not available.
² Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.

³ Includes population of Indian Territory.

POPULATION.

NUMBER OF MALES ENGAGED IN GAINFUL OCCUPATIONS COMPARED WITH THE TOTAL MALE POPULATION 10 YEARS OF AGE AND OVER, BY DIVISIONS AND STATES: 1880-1910.

¹ Figures for 1890 are exclusive of females in Indian Territory and on Indian reservations, areas specially enumerated at that census, but for which occupation statistics are not available.
² Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.
³ Includes population of Indian Territory.

PROPORTION OF POPULATION 10 YEARS OF AGE AND OVER ENGAGED IN GAINFUL OCCUPATIONS FOR BOTH SEXES IN 1910 AND 1900, AND FOR EACH SEX IN 1910, BY STATES.

Outlying territories.—Table 7 shows for Alaska and Hawaii in 1910 and 1900, and for Porto Rico in 1910 and 1899,1 the number of persons of each sex 10 years of age and over engaged in gainful occupations and, in each case, the proportion which such persons formed of the total population and of the population 10 years of age and over.

This table shows that in Alaska the proportion both of the total population and of the population 10 years of age and over engaged in gainful occupations in 1910 was much higher than in the United States.2 The high proportion of gainful workers in Alaska came from the very high proportion for the male sex, since the proportion for the female sex was but slightly over one-half as high as in the United States. The very high proportion of the males of Alaska engaged in gainful occupations resulted largely from the very low proportion of boys under 20 years of age-18 per cent as compared with a proportion of 41.1 per cent in the United States. There was a large increase

in Alaska from 1900 to 1910 in the proportion both of the total population and of the population 10 years of age and over engaged in gainful occupations. This increase, however, was confined entirely to the male sex, where it was especially marked. In striking contrast to the great increase in the proportion of the males gainfully occupied was the large decrease in the proportion of the females gainfully occupied—a decrease from 20.5 per cent in 1900 to 9.3 per cent in 1910 for all females, and from 25.9 per cent in 1900 to 12.4 per cent in 1910 for the females 10 years of age and over. This extraordinary decrease resulted largely from the fact that the proportion which Indian females constituted of all females 10 years of age and over decreased from 80.9 per cent in 1900 to 63.1 per cent in 1910, together with the fact that the proportion of the occupied Indian females decreased from 28.2 per cent in 1900 to 8.7 per cent in 1910. Exclusive of the Indian element, the proportion of the females 10 years of age and over engaged in gainful occupations increased from 16 per cent in 1900 to 18.9 per cent in 1910.

In Hawaii in 1910 the proportion both of the total population and of the population 10 years of age and over engaged in gainful occupations was much higher than in the United States.2 This difference is accounted for partly by the great preponderance of males in the population of Hawaii and partly by the fact that a much larger proportion of the males in Hawaii are in the age period 21 to 44 than is the case in the United States. While in the United States in 1910 there were 106 males to each 100 females, in Hawaii there were 178.9 males to each 100 females. Among the Chinese of Hawaii there were 378.9 males to each 100 females, and among the Japanese there were 220.1 males to each 100 females. Since both in the United States and in Hawaii a much larger proportion of the males than of the females were gainfully occupied in 1910, this great excess of males in the population of Hawaii accounts in part for the higher proportion of gainful workers in the population. In 1910, 37.5 per cent of the males of the United States were in the age period 21 to 44 years, while 52.5 per cent of the males of Hawaii were in this age period. Since both in the United States and in Hawaii the proportion of gainful workers was highest in the age period 21 to 44, the larger proportion of the males in this age period in Hawaii accounts in part for the higher proportion of gainful workers in the population. This also accounts largely for the proportion of gainful workers being so much higher for the males of Hawaii than for the males of the United States. In Hawaii in 1910 the proportion of gainful workers was smaller in the total female population but larger in the female population 10 years of age and over than in the United States. From 1900 to 1910 there was a decrease in

¹ A census of Porto Rico was taken under the direction of the War Department of the United States in 1899. One of the subjects covered by this census was the occupations of the people. A total of 1,670 children under 10 years of age were included in the 316,365 persons reported as engaged in gainful occupations. The proper deductions have been made for the purpose of comparison with the Thirteenth Census occupation statistics, which are confined to gainfully occupied persons 10 years of age and over.

2 See Table 2, p. 30.

³ Includes persons of unknown age.

the proportion that persons engaged in gainful occupations formed both of the total population of Hawaii and of the population 10 years of age and over. This decrease was due in part to the fact that the number of males to each 100 females in the Hawaiian population decreased from 223.3 in 1900 to 178.9 in 1910, and in part to the fact that the proportion of the males under 15 years of age increased from 16.8 per cent in 1900 to 23.5 per cent in 1910. The decrease in the proportion of the population gainfully occupied was confined entirely to the male sex, since from 1900 to 1910 there was a marked increase in the proportion both of the total female population and of the female population 10 years of age and over engaged in gainful occupations.

In Porto Rico in 1910 a smaller proportion both of the total population and of the population 10 years of age and over was engaged in gainful occupations than was the case in the United States.¹ In the total male population, also, the proportion of gainful workers was smaller in Porto Rico than in the United States, due

¹ See Table 2, p. 30.

NUMBER AND PROPORTION OF PERSONS IN THE GENERAL DIVISIONS OF OCCUPATIONS.

United States.—Table 8 shows, for both sexes and for each sex separately, the gainful workers in 1910 distributed by general divisions of occupations. Since, in grouping occupations for presentation in the condensed tables of this report, each occupation was classified in that part of the industrial field in which it is most commonly pursued, this table does not represent the total number of persons occupied in the different industries or service groups of each respective general division of occupations, but rather the number of persons pursuing the occupations which are most common to each respective general division of occupations. Clerical occupations, which are not peculiar to any one of the eight general divisions, are reported here as a separate class.

According to Table 8, practically one-third (33.2 per cent) of all gainful workers in the United States in 1910 were engaged in agriculture, forestry, and animal husbandry; and considerably more than onefourth (27.9 per cent) were engaged in manufacturing and mechanical industries. Thus, over three-fifths of all gainful workers were occupied in these two general divisions of occupations. The remaining two-fifths of the workers were distributed among the other seven large classes of occupations, no class furnishing employment to as many as 10 per cent of all gainful workers. For the males, as for both sexes combined, agriculture, forestry, and animal husbandry gave employment to the largest proportion of the gainful workers, 36.1 per cent, and manufacturing and mechanical industries ranked second, with 29.4 per cent.

largely to the fact that in Porto Rico 44 per cent of the males were under 15 years of age, as against only 31.5 per cent in the United States. But in the male population 10 years of age and over the proportion of gainful workers was larger in Porto Rico than in the United States. The proportion of gainful workers both in the total female population and in the female population 10 years of age and over was smaller in Porto Rico in 1910 than in the United States. The fact that in 1910 in Porto Rico 41.9 per cent, while in the United States only 32.7 per cent of the females were under 15 years of age accounts partially for the lower proportion of gainful workers in the female population of Porto Rico. In Porto Rico from 1899 to 1910 there was an increase in the proportion of gainful workers, both in the total population and in the population 10 years of age and over. There was a slight increase in the proportion of all males, but a slight decrease in the proportion of the males 10 years of age and over gainfully occupied. The proportion of all females and of the females 10 years of age and over engaged in gainful occupations was larger in 1910 than in 1899.

1 Less than one-tenth of 1 per cent.

Domestic and personal service was the principal field of employment for female workers in 1910, 31.3 per cent of them being engaged in this branch of occupations, as compared with 22.4 per cent in agriculture, forestry, and animal husbandry, and 22.5 per cent in manufacturing and mechanical industries.

Because of the changes made in the classification of occupations at the Thirteenth Census, it is impossible to classify the occupations for preceding censuses according to the scheme followed at the Thirteenth Census. It is possible, however, to classify the Thir-

teenth Census occupations according to the scheme followed at preceding censuses. In the following table, for purposes of comparison, the Thirteenth Census occupations are arranged according to the five general divisions of occupations followed at preceding censuses:

The decrease from 1900 to 1910 in the proportion of males engaged in domestic and personal service, as shown by Table 9, was due mainly to the great decrease in the number of "laborers (not specified)"-a decrease from 2,505,287 to 1,297,408.1 In only one other occupation in domestic and personal service-"sextons"—was there a decrease during this period in the number of male workers. The marked increase from 1900 to 1910 in the proportion of females engaged in agricultural pursuits was discussed in a previous section (p. 27). The decrease in the proportion of females engaged in domestic and personal service is accounted for in part by a decrease in the number of female "laborers (not specified)" from 123,975 in 1900 to 19,998 in 1910,1 and in part by the great increase in the proportion engaged in agricultural pursuits and in trade and transportation. The great increase in the proportion engaged in agricultural pursuits and in trade and transportation also accounts mainly for the decrease in the proportion engaged in manufacturing and mechanical pursuits.

Divisions and states.—The distribution of persons engaged in gainful occupations in 1910, according to general divisions of occupations, is shown for each geographic division and for each state in Table 10 (p. 44). The proportion in each general division of occupations in 1910 is shown graphically for each state in the diagram on page 43.

This table shows that, while in the United States as a whole practically one-third of the gainful work-

ers in 1910 were engaged in agriculture, forestry, and animal husbandry, this proportion varied from one-tenth in the New England and Middle Atlantic divisions to over six-tenths in the East South Central and West South Central divisions. Only in six states—Pennsylvania, West Virginia, Montana, Wyoming, Arizona, and Nevada-did the extraction of minerals furnish employment for as many as onetenth of the gainful workers in 1910. Manufacturing and mechanical industries gave employment to almost one-half of the gainful workers in New England, to over two-fifths of those in the Middle Atlantic division, but to only about one-eighth of those in the East South Central and West South Central divisions. The proportion of the gainful workers engaged in transportation varied from 4 per cent in the East South Central to 10.3 per cent in the Mountain and Pacific divisions, while the proportion engaged in trade varied from 5.3 per cent in the East South Central to 12.6 per cent in the Pacific division, and was much higher in the geographic divisions of the North and in the Pacific division than in the geographic divisions of the South and in the Mountain division. The proportion engaged in professional service varied from 2.6 per cent in the East South Central to 6 per cent in the Pacific division, and was considerably lower in each of the agricultural divisions of the South than in the other geographic divisions. The proportion engaged in domestic and personal service varied from 8.1 per cent in the West South Central to 11.8 per cent in the Middle Atlantic division; and the proportion engaged in clerical occupations varied from 1.7 per cent in the East South Central to 7.1 per cent in the Middle Atlantic division.

In the New England division almost one-half (49.1 per cent) of the gainful workers in 1910 were engaged in manufacturing and mechanical industries; and in each state of this division except Vermont, a larger proportion of the gainful workers were engaged in this than in any other branch of occupations. While only 10.4 per cent of the gainfully occupied persons in New England were engaged in agriculture, forestry, and animal husbandry, the proportion was 26.9 per cent in Maine, 19.1 per cent in New Hampshire, and 34.4 per cent in Vermont.

In the Middle Atlantic division 40.6 per cent of the gainful workers in 1910 were engaged in manufacturing and mechanical industries, and in the state of New Jersey the proportion in this class of occupations was 45.8 per cent. Trade gave employment to 12 per cent of the gainful workers, domestic and personal service to 11.8 per cent, and agriculture, forestry, and animal husbandry to 10 per cent. In Pennsylvania, 10.5 per cent of the gainful workers were engaged in the extraction of minerals.

In the East North Central division the most important class of occupations in 1910 was manufacturing and mechanical industries, which gave employment to almost one-third (33.2 per cent) of the gainful workers. Next in importance was agriculture, forestry, and animal husbandry, in which over one-fourth (25.6 per cent) of the gainful workers were employed.

In the West North Central division over two-fifths (41.2 per cent) of the gainful workers of the division were engaged in agriculture, forestry, and animal husbandry, the proportion ranging from 34.4 per cent in Minnesota to 60.2 per cent in North Dakota. While 20 per cent of the workers in this division were engaged in manufacturing and mechanical industries, the proportion varied in the states from 9.8 per cent in North Dakota to 23.6 per cent in Missouri.

More than one-half (51.4 per cent) of the gainful workers in the South Atlantic division in 1910 were engaged in agriculture, forestry, and animal husbandry. In Delaware and in Maryland manufacturing and mechanical industries, and in the District of Columbia domestic and personal service, gave employment to the largest proportion of the gainful workers; but in each of the remaining states agriculture, forestry, and animal husbandry was far the most important class of occupations. In West Virginia the proportion of the workers engaged in the extraction of minerals (14.4 per cent) was larger than in any of the other states except Arizona and Nevada; and, because of the location of the numerous Federal bureaus in the District of Columbia, the proportion of the gainful workers engaged in clerical occupations there (15.3 per cent) was much larger than in any state.

In the East South Central division 63.2 per cent, and in the West South Central division 60.1 per cent of the

gainfully occupied persons in 1910 were engaged in agriculture, forestry, and animal husbandry; and in each of the states in these two geographic divisions over one-half of the gainful workers were engaged in this branch of occupations, the proportion rising to 70.4 per cent in Arkansas and to 77.2 per cent in Mississippi. Only one-eighth of the gainful workers in these two divisions were occupied in manufacturing and mechanical industries in 1910.

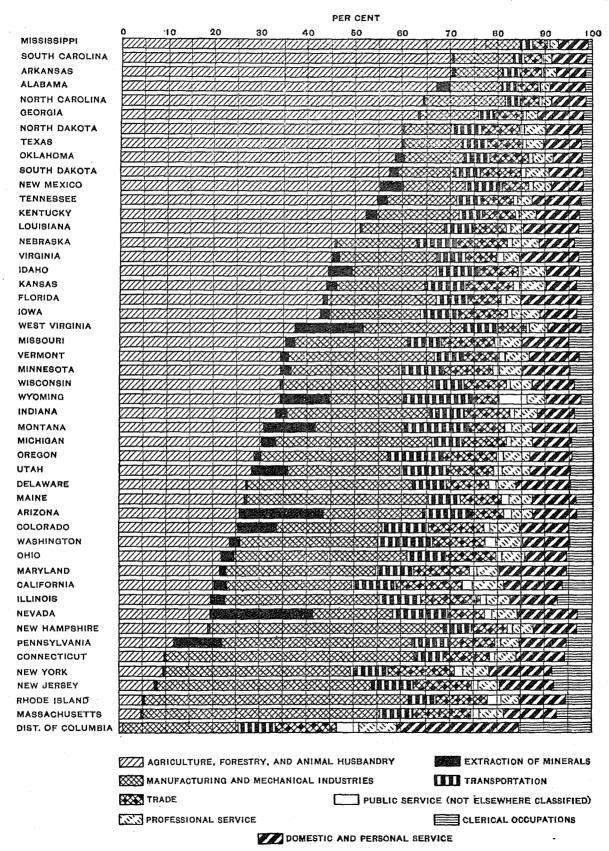

In the Mountain division almost one-third (32.4 per cent) of the persons engaged in gainful occupations in 1910 were employed in agriculture, forestry, and animal husbandry; but in the states the proportion ranged from less than one-fifth (19.5 per cent) in Nevada to over one-half (55.1 per cent) in New Mexico. While the proportion of the workers engaged in the extraction of minerals in 1910 was largest in the Mountain division, less than one-tenth (9.4 per cent) of the workers of this division were engaged in this branch of occupations. However, the proportion was 17.7 per cent in Arizona and 21.9 per cent in Nevada.

In the Pacific division in 1910, 27.2 per cent of the gainful workers were engaged in manufacturing and mechanical industries, and 22.6 per cent in agriculture, forestry, and animal husbandry, thus showing that practically one-half of the gainful workers were in these two general divisions of occupations. Trade gave employment to 12.6 per cent of the gainful workers, domestic and personal service to 11.3 per cent, and transportation to 10.3 per cent.

The males engaged in gainful occupations in 1910 are distributed by general divisions of occupations for each geographic division and for each state, in Table 11 (p. 46).

Since, in the United States in 1910, males constituted 85.7 per cent of the persons engaged in agriculture, forestry, and animal husbandry, 99.9 per cent of the persons engaged in the extraction of minerals, 82.9 per cent of the persons engaged in manufacturing and mechanical industries, 96 per cent of the persons engaged in transportation, 87.1 per cent of the persons engaged in trade, and 97 per cent of the persons engaged in public service, the proportion of the male gainful workers engaged in each of these six general divisions of occupations conforms very closely to that for both sexes, discussed in the preceding paragraphs. Practically the only difference is that a somewhat larger proportion of the males than of both sexes was engaged in each of these six general divisions of occupations. This close similarity between all gainful workers and the male gainful workers in the proportion engaged in each of these six general divisions of occupations holds not only for the entire United States but for each geographic division and for each state. The proportion of the male workers engaged in professional service, in domestic and personal service, and in clerical occupations, however, was considerably smaller than the proportion for both sexes.

In 1910, 3.1 per cent of the males engaged in gainful occupations in the United States were in professional service, as contrasted with a proportion of 4.4 per cent for all gainful workers. Likewise, in each geographic division and in each state, a smaller proportion of the male workers than of all workers was engaged in professional service. While 9.9 per cent of all gainful workers in 1910 were engaged in domestic and personal service, only 4.1 per cent of the male gainful workers were so occupied. In each geographic division, also, and in each state, a smaller per cent of the male workers than of all gainful workers were engaged in domestic and personal service. In 1910, 3.8 per cent of all gainfully occupied males were engaged in clerical occupations, the proportion ranging from 1.7 per cent in the East South Central to 6.2 per cent in the Middle Atlantic division, and from 1 per cent in Mississippi to 15 per cent in the District of Columbia. The large proportion in the District of Columbia is accounted for by the location there of the departments of the Federal Government.

The females engaged in gainful occupations in 1910 are distributed by general divisions of occupations, for each geographic division and for each state, in Table 12 (p. 48).

This table shows that in the United States in 1910 22.4 per cent of the gainfully occupied females were engaged in agriculture, forestry, and animal husbandry, the proportion varying from 1.4 per cent in New England to 59.4 per cent in the East South Central division. The very high proportion in the agricultural divisions of the South is accounted for by the large proportion of negroes in the female population. Manufacturing and mechanical industries gave employment to 22.5 per cent of the gainfully occupied females, but this proportion varied from 5.5 per cent in the West South Central and 6.8 per cent in the East South Central divisions to 45.3 per cent in New England. The proportion engaged in transportation varied from five-tenths of 1 per cent in the South Atlantic and East South Central divisions to 2.5 per cent in the Pacific division; and the proportion engaged in trade varied from 2 per cent in the East South Central to 9.9 per cent in the Pacific division. The Mountain division had the highest proportion engaged in public service, seven-tenths of 1 per cent. The proportion engaged in professional service ranged from 4.1 per cent in the East South Central to 17.3 per cent in the West North Central division. Domestic and personal service furnished employment to a larger proportion of the gainfully occupied females in 1910 than did any other general division of occupations, 31.3 per cent. The proportion was lowest in the East South Central division, 25.3 per cent, and highest in the Mountain division, 39.5 per cent. Clerical occupations were followed by 7.3 per cent of the female gainful workers in 1910, the proportion varying from 1.8 per cent in the East South Central to 13.4 per cent in the Pacific division.

In New England over 7 out of 10 of the gainfully occupied females in 1910 were engaged in two large branches of occupations—manufacturing and mechanical industries, which gave employment to 45.3 per cent, and domestic and personal service, which gave employment to 27.9 per cent.

In the Middle Atlantic states 35.9 per cent of the gainfully occupied females in 1910 were engaged in manufacturing and mechanical industries and 33.4 per cent were engaged in domestic and personal service, these two branches of occupations together giving employment to almost seven-tenths (69.3 per cent) of the female workers in these states.

In the East North Central division in 1910 over onefourth (26.6 per cent) of the gainfully occupied females were engaged in manufacturing and mechanical industries and over one-third (33.8 per cent) were engaged in domestic and personal service, more than threefifths (60.4 per cent) thus being engaged in these two divisions of occupations.

In the West North Central division only 8.8 per cent of the gainfully occupied females in 1910 were engaged in agriculture, forestry, and animal husbandry, but the proportion rose to 16.7 per cent in North Dakota and to 18.3 per cent in South Dakota. The proportion engaged in manufacturing and mechanical industries was 18 per cent for the division, but varied in the states from 8.1 per cent in North Dakota to 22 per cent in Missouri. The proportion engaged in professional service was higher than in any other geographic division, 17.3 per cent, as compared with 9.1 per cent in the entire United States. Likewise, in each state in this division the proportion engaged in professional service was far higher than in the United States; and in Iowa, South Dakota, Nebraska, and Kansas over one-fifth of the gainful females in 1910 were engaged in professional service. The proportion engaged in domestic and personal service varied from 32.9 per cent in Kansas to 45 per cent in North Dakota.

In the South Atlantic division 46.2 per cent of the gainfully occupied females in 1910 were engaged in agriculture, forestry, and animal husbandry. Excluding the District of Columbia, this proportion was 4.2 per cent in Maryland, 6.2 per cent in Delaware, and in the other states of the division varied from 16.8 per cent in West Virginia to 71.4 per cent in South Carolina. These great variations were due mainly to differences in the proportion of negroes in the female population. After agriculture, forestry, and animal husbandry, domestic and personal service was the most important branch of occupations for the gainfully occupied females of the South Atlantic division, giving employment to 30.8 per cent of them. Manufacturing and mechanical industries gave employment to 12.5 per cent, the proportion varying in the states (excluding the District of Columbia) from 7 per cent in Georgia and 7.8 per cent in South Carolina to 25 per cent in Delaware and to 30 per cent in Maryland. The high proportion of females engaged in professional service in West Virginia, 12 per cent, as contrasted with 4.8 per cent for the entire geographic division, is accounted for mainly by the low proportion of negroes in the female population of West Virginia, 4.8 per cent, as contrasted with 34.4 per cent in the entire geographic division. And the high proportion of the gainfully occupied females engaged in clerical occupations in the District of Columbia, 16 per cent, as contrasted with 2.6 per cent for the entire geographic division, and with 7.3 per cent for the entire United States, is accounted for by the large number of female clerks in the Federal departments.

In the East South Central division in 1910 almost three-fifths (59.4 per cent) of the gainfully occupied females were engaged in agriculture, forestry, and animal husbandry, the proportion varying from a little more than one-fifth (20.8 per cent) in Kentucky to nearly four-fifths (79.1 per cent) in Mississippi. The greater relative importance of agriculture and the larger proportion of negroes in the female population explain the high proportion in Alabama (70.9 per cent) and Mississippi (79.1 per cent), as compared with the proportion in Kentucky (20.8 per cent) and Tennessee (36.9 per cent). Domestic and personal service gave employment to 25.3 per cent of the gainfully occupied females of this division in 1910, the proportion varying from 14.7 per cent in Mississippi to 41.6 per cent in Kentucky.

In the West South Central division more than eighttenths (82.2 per cent) of the gainfully occupied females in 1910 were engaged in two general divisions of occupations—agriculture, forestry, and animal husbandry which gave employment to 55.8 per cent, and domestic and personal service which gave employment to 26.4 per cent. In Oklahoma the low proportion of negroes in the female population, 8.5 per cent, as contrasted with 23.4 per cent for the entire geographic division, accounts mainly for the low proportion of females engaged in agriculture, forestry, and animal husbandry—39.8 per cent, as compared with 55.8 per cent for the entire geographic division—and also for the high proportion engaged in professional service—12.4 per cent, as contrasted with 6.1 per cent for the division.

In the Mountain division in 1910 agriculture, forestry, and animal husbandry was an important field of occupations for females in but two states, Idaho and New Mexico. In Idaho 12.6 per cent, and in New Mexico 22.7 per cent of the gainfully occupied females were engaged in this branch of occupations. Manufacturing and mechanical industries gave employment to 15.3 per cent of the gainfully occupied females in the division, the proportion varying from 8.8 per cent in Nevada to 30.6 per cent in Arizona, where the large number of Indian female weavers mainly accounts for the large proportion. The proportion of the gainfully occupied females engaged in professional service in this division, and in each of the states which comprise

it, was considerably larger than the proportion for the entire United States; and the proportion engaged in domestic and personal service, 39.5 per cent, was higher than in any other geographic division.

Of the gainfully occupied females in the Pacific division in 1910, 36 per cent were engaged in domestic and personal service, 16.6 per cent in professional service, 16.4 per cent in manufacturing and mechanical industries, and 13.4 per cent in clerical occupations. The proportion engaged in clerical occupations was larger than in any other geographic division, and the proportion engaged in professional service was larger than in any other geographic division except the West North Central.

Outlying territories.—The following table shows, for Alaska, Hawaii, and Porto Rico, the gainful workers of each sex in 1910 distributed by general divisions of occupations.

1 Less than one-tenth of 1 per cent.

In Alaska, as shown by Table 13, 28.4 per cent of the gainful workers in 1910 were engaged in the extraction of minerals and 22.9 per cent in manufacturing and mechanical industries. These two general divisions of occupations together thus gave employment to more than one-half (51.3 per cent) of the

gainful workers. Agriculture, forestry, and animal husbandry gave employment to 11.4 per cent of the gainful workers, and domestic and personal service to 16.8 per cent. As compared with the United States,¹ a far larger proportion of the workers in Alaska were engaged in the extraction of minerals and in domestic and personal service, and a somewhat larger proportion in transportation and in public service, but the proportion engaged in agriculture, forestry, and animal husbandry was much smaller. The proportions for the males differed little from the proportions for both sexes. Of the gainfully occupied females, 36.2 per cent were engaged in manufacturing and mechanical industries, 13.5 per cent in professional service, and 38.5 per cent in domestic and personal service. These three general divisions of occupations gave employment to 88.2 per cent of all gainfully occupied females. The principal manufacturing occupations followed by the females of Alaska were fish curing and packing, basket making, dressmaking, and sewing. As compared with the United States,1 a much smaller proportion of the females in Alaska were engaged in agriculture, forestry, and animal husbandry, and a much larger proportion were engaged in professional service.

In Hawaii considerably more than one-half (55.7 per cent) of the gainful workers in 1910 were engaged in agriculture, forestry, and animal husbandry. Manufacturing and mechanical industries gave employment to 15.2 per cent of the gainful workers, transportation to 6.6 per cent, trade to 5.8 per cent, and domestic and personal service to 9.3 per cent. The proportion engaged in agriculture, forestry, and animal husbandry was much larger, and the proportion engaged in manufacturing and mechanical industries was much smaller than was the case in the United States.1 The proportions for the males did not vary materially from the proportions for both sexes. Of the gainfully occupied females, 42.8 per cent were engaged in agriculture, forestry, and animal husbandry, and 33.5 per cent in domestic and personal service. These two general divisions of occupations together gave employment to over three-fourths (76.3 per cent) of the

 $^{\rm 1}\,\mathrm{See}$ Tables 10, 11, and 12, pp. 44 to 49.

gainfully occupied females. The proportion engaged in agriculture, forestry, and animal husbandry was much larger, and the proportion engaged in manufacturing and mechanical industries and in clerical occupations was much smaller than was the case in the United States.¹

In Porto Rico agriculture, forestry, and animal husbandry was by far the most important branch of occupations, giving employment to more than threefifths (61.1 per cent) of the gainful workers in 1910. Manufacturing and mechanical industries gave employment to 13.5 per cent of the gainful workers and domestic and personal service to 13.9 per cent. As compared with the United States, a much larger proportion of the gainful workers in Porto Rico was engaged in agriculture, forestry, and animal husbandry, a somewhat larger proportion in domestic and personal service, but a smaller proportion in each of the other general divisions of occupations. Of the gainfully occupied males of Porto Rico in 1910, 72.5 per cent were engaged in agriculture, forestry, and animal husbandry, 11 per cent in manufacturing and mechanical industries, and 7.8 per cent in trade. These three general divisions of occupations combined thus gave employment to more than nine-tenths (91.3 per cent) of the gainfully occupied males of Porto Rico. The proportion engaged in agriculture, forestry, and animal husbandry was a little more than double the proportion in the United States,1 but the proportion in each of the other general divisions of occupations was higher in the United States than in Porto Rico. Of the gainfully occupied females of Porto Rico in 1910, 14 per cent were engaged in agriculture, forestry, and animal husbandry, 23.7 per cent in manufacturing and mechanical industries, and 58.7 per cent in domestic and personal service. The proportion engaged in agriculture, forestry, and animal husbandry was much smaller than in the United States 1 or in Hawaii; the proportion engaged in manufacturing and mechanical industries was slightly higher than in the United States and much higher than in Hawaii; and the proportion engaged in domestic and personal service was much higher than in the United States or in Hawaii.

NUMBER AND PROPORTION OF PERSONS IN SPECIFIED OCCUPATIONS.

Principal occupations in 1910.—Table I (p. 91) shows, for the United States, the number and sex of the persons 10 years of age and over engaged in 1910 in each of 428 specified occupations and occupation groups. Table 14 shows the number of males and of females engaged in each of 116 principal occupations pursued in the United States in 1910. In only 17 of these occupations did the number of females exceed the number of males.

Comparison with previous censuses.—The new classification of occupations followed at the Thirteenth Census shows occupations in so much greater detail than they were shown at preceding censuses that it was im-

possible to rearrange the occupations of preceding censuses according to the Thirteenth Census classification. But comparison with preceding censuses is of such great importance that the Thirteenth Census occupations have been rearranged according to the occupation classification of the Twelfth Census, notwithstanding the fact that this classification was in many respects unsatisfactory. The results of this reclassification are given in Table 15 (p. 54), which shows, for both sexes and for each sex separately, the number of persons engaged in the different occupation groups of the 1900 classification at each of the censuses 1880, 1890, 1900, and 1910.

In order to rearrange the Thirteenth Census occupations according to the Twelfth Census classification, it was necessary in a few cases to combine two or more of the Twelfth Census occupation groups. Likewise, some changes were made in the assignment of occupa-

tion designations under the class heads for the censuses of 1880 and 1890, in order that the class totals might correspond with those for 1900; consequently, the totals as presented in Table 15 differ from those in the printed reports for these two censuses.

Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.
Fruit growers (except grape growers) included in 1890 with farmers, planters, and overseers; classified in 1910 and 1990 with gardeners, florists, and nurserymen, etc.
Figures for 1910 approximate only.
Scientific persons combined in 1890 with teachers.
Other professional service (except veterinary surgeons) combined in 1880 with "Other domestic and personal service."
Partly estimated.
Includes officials of mining and quarrying companies (number not stated) classified in 1910 and 1900 with manufacturers and officials under "Manufacturing and mechanical pursuits" (miscellaneous industries).
Salesmen and saleswomen are often returned as "Clerks in stores."

NUMBER OF PERSONS 10 YEARS OF AGE AND OVER ENGAGED IN SPECIFIED OCCUPATIONS ARRANGED ACCORDING TO THE CLASSIFICATION OF 1900, FOR BOTH SEXES AND FOR EACH SEX SEPARATELY: 1880-1910—Continued.

Outside of trade and transportation and manufacturing and mechanical pursuits, the reclassification of the Thirteenth Census occupations according to the Twelfth Census classification is believed to be fairly accurate, except in a few occupations. In trade and transportation, and in manufacturing and mechanical pursuits, the reclassification probably is fairly accurate in about 75 per cent of the occupations and poor in about 25 per cent. In case of such large and general occupation groups as "Other iron and steel workers," "Other woodworkers," "Other metal workers," and "Other textile workers," the reclassification at best can be considered only approximately

correct. In case of the five general divisions of occupations, however, the per cent of error in reclassification is believed to be practically negligible.

The 1910 classification of occupations is so different from that of 1900 that in many cases the 1910 figures for a specific occupation, as presented in Table 15, differ very much from those for the same occupation, as presented in the other tables of the report. In any such case, it is evident that the figures presented in this comparative table can not properly be used in connection with the figures presented in the other tables of the report.

¹ Corrected figures; for explanation, see Occupation Report for 1900, pp. lxvi-lxxiii.
2 Does not include molders or apprentices.
8 Does not include apprentices.
4 Figures for 1910 and 1900 not comparable,
5 Figures for 1910 approximate only.
5 Includes box-factory operatives; probably includes box makers (wood).
6 Includes box-factory operatives; probably included in 1910 and 1900 with "Other textile workers."
7 Does not include carpet makers (rag), included in 1910 and 1900 with "Other textile workers."
8 Does not include officials of mining and quarrying companies, classified in 1890 with officials of banks and companies, under "Trade and transportation,"

PERSONS OCCUPIED DISTRIBUTED BY SEX.

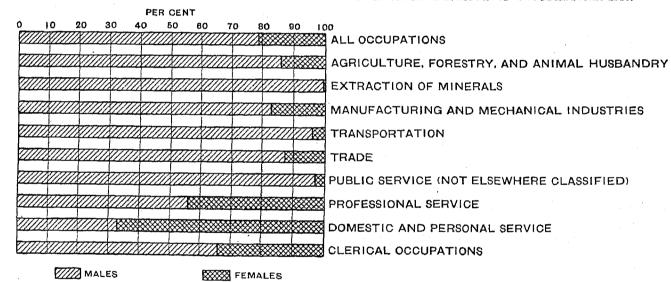

United States.—Table 16 shows, for all occupations and for each general division of occupations, the number of males and of females gainfully occupied in 1910 and the per cent which the workers of each sex constituted of the total.

| Table 16 GENERAL DIVISION OF | Matala | MALE | | FEMALE. | | |
|--|----------------|--------------|--------------|-------------|---------------|--|
| OCCUPATIONS. | Total: 1910 | Number. | Per cent. | Number, | l'er cent. | |

| Agriculture, forestry, and animal husbandry Extraction of minerals | 12,659.203 | 10, 851, 702 | 85.7 | 1,807,501 | 14.3 | |
| | 964,824 | 963, 730 | 99.9 | 1,094 | 0.1 | |
| industries. Transportation. Trade. Public service (not elsewhere | 10,658,881 | 8,837,901 | 82.9 | 1,820,980 | 17.1 | |
| | 2,637,671 | 2,531,075 | 96.0 | 106,596 | 4.0 | |
| | 3,614,670 | 3,146,582 | 87.1 | 468,088 | 12.9 | |
| classified). Professional service Domestic and personal service Clerical occupations | 459, 291 | 445,733 | 97.0 | 13,558 | 3.0 | |
| | 1, 663, 569 | 929,684 | 55.9 | 733,885 | 44.1 | |
| | 3, 772, 174 | 1,241,328 | 32.9 | 2,530,846 | 67.1 | |
| | 1, 737, 053 | 1,143,829 | 65.8 | 593,224 | 34.2 | |

These figures show that in 1910 domestic and personal service was the only general division of occupations in which the women outnumbered the men, there being in this general division more than two women employed to each man. In professional service there were four women to every five men, a large proportion of the women being teachers. In clerical occupations one-third of the persons were women. In manufacturing and mechanical industries women constituted one in six, in agriculture, forestry, and animal husbandry one in seven, and in trade one in eight of the gainful workers; they constituted only 4 per cent of the persons engaged in transportation, 3 per cent of the persons engaged in public service, and but one-tenth of 1 per cent of the persons engaged in the extraction of minerals.

The proportion of each sex in all gainful occupations and in each general division of occupations in 1910 is also shown graphically in the following diagram:

PROPORTION OF MALES AND OF FEMALES IN EACH GENERAL DIVISION OF OCCUPATIONS: 1910.

In Table 17, for purposes of comparison with 1900, the Thirteenth Census occupations are rearranged, by sex, according to the five general divisions followed at previous censuses.

The marked increase from 1900 to 1910, as shown by Table 17, in the proportion which females constituted of all persons engaged in agricultural pursuits was discussed in a previous section (see p. 27). The increase during this period in the proportion which females constituted of all persons engaged in domestic and personal service is accounted for in part by the great decrease in the number of "laborers (not specified)," a very large proportion of whom were males. The great difference shown by Tables 16 and 17 in the proportion which females constituted of all persons engaged in domestic and personal service in 1910 is accounted for by the fact that "soldiers, sailors, and marines (U. S.)," "watchmen, policemen, firemen, etc.," and "laborers (not specified)," classified under domestic and personal service in 1900, were, with the

exception of a part of the "laborers (not specified)," classified elsewhere in 1910.

etc.," and "laborers (not specified)," classified under demestic and personal service in 1900, were, with the each geographic division and for each state, the per

cent which the workers of each sex constituted of all workers and of the workers in each general division of occupations in 1910.

This table shows that, in the United States in 1910, 78.8 per cent of the persons engaged in gainful occupations were males and 21.2 per cent were females. Males constituted over seven-tenths of the gainful workers in each geographic division, and over eighttenths in the East North Central, the West North Central, the Mountain, and the Pacific divisions. In the Middle Atlantic and West South Central divisions females constituted over one-fifth, and in the New England, South Atlantic, and East South Central divisions over one-fourth of the gainful workers. In the District of Columbia, South Carolina, and Mississippi over one-third of the gainful workers in 1910 were females, but in each of the remaining states over two-thirds of the gainful workers in 1910 were males, the proportion rising to over nine-tenths in Idaho. Wyoming, and Nevada.

Since in any area the proportion which females engaged in gainful occupations form of all persons engaged in gainful occupations is governed largely by the proportion of the female population gainfully occupied, it follows that variations between different areas in the proportion which gainfully occupied females constituted of all gainful workers must in the main be due to the same causes which produced the variations in the proportion of the female population gainfully occupied. For example, the high proportion which females in 1910 constituted of all gainful workers in the New England and Middle Atlantic divisions, as compared with the East North Central and West North Central divisions, corresponds very closely with the high proportion of gainful workers in the female population 10 years of age and over in the New England and Middle Atlantic divisions, as compared with the East North Central and West North Central divisions (see Table 1, p. 26); and in each case the higher proportion in the New England and Middle Atlantic divisions was due mainly to the same causes a larger proportion of foreign born in the female population, a larger proportion of urban population, and the existence of more industries which furnished suitable employment to females. Likewise, the high proportion which females constituted of all gainful workers in the South Atlantic, East South Central, and West South Central divisions, as compared with the Mountain and Pacific divisions, is accounted for mainly by the large negro female population in the South, together with the fact that a much larger proportion of the negro than of the white females were gainfully occupied in 1910. Also, in the different states the variations in the proportion which females constituted of all gainful workers in 1910 corresponded in general with the variations in the proportion of the female population 10 years of age and over gainfully occupied in 1910 (see Table 1), and, usually, the causes of the

variations were the same in each case. However, since in 1910, 81.3 per cent of the males and only 23.4 per cent of the females 10 years of age and over were engaged in gainful occupations, the proportion which females constituted of all gainful workers in any area was influenced to some extent by the number of males to each 100 females. Thus, the fact that in the Mountain division there were 127.9 males and in the Pacific division 129.5 males to each 100 females, accounts in part for the comparatively low proportion which females constituted of all gainful workers in each of these divisions. In Nevada in 1910 the proportion of the females 10 years of age and over engaged in gainful occupations was larger than in any other state in the Mountain division (see Table 1, p. 26), but the proportion which the females constituted of all gainful workers was smaller in Nevada than in any other state in the division except Wyoming. This unusual condition probably was due to the fact that in Nevada the number of males to each 100 females, 179.2, was larger than in any other state in the United States, while the proportion of the males 10 years of age and over engaged in gainful occupations, 87.3 per cent, was also very large.

The proportion of each sex in all gainful occupations in 1910, as compared with 1900, is shown graphically for each state in the diagram on page 60, while the proportion of males and females in each principal occupation in which the workers of each sex constituted 1 per cent or more of the total workers in the United States in 1910 is shown graphically in the

diagram on page 61.

In the United States as a whole in 1910 females constituted 14.3 per cent of all persons engaged in agriculture, forestry, and animal husbandry, but this proportion varied from 3.1 per cent in the Pacific to 24.6 per cent in the East South Central division. and exceeded 4 per cent only in the South Atlantic, the East South Central, and the West South Central divisions, where the high proportions are explained by the large numbers of negro female agricultural laborers. The great variation in the proportions between the different states of these three geographic divisions are due mainly to differences in the proportion of negroes in the population. The large negro population and the great importance of cotton raising together account for the exceptionally large proportion which females constituted of all persons engaged in agriculture, forestry, and animal husbandry in North Carolina, South Carolina, Georgia, Alabama, Mississippi, Arkansas, and Louisiana in

In the United States, in each of the geographic divisions, and in each of the states males in 1910 had practically a complete monopoly of the occupations peculiar to the extraction of minerals. Few of these occupations are suitable for females and they are usually prohibited by law from pursuing them.

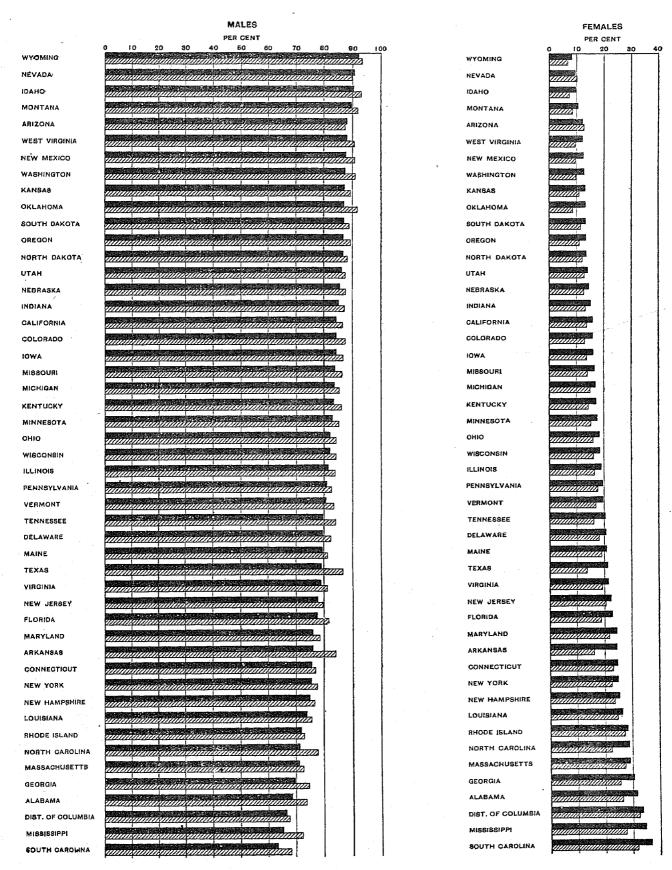

PER CENT DISTRIBUTION, BY SEX, OF PERSONS 10 YEARS OF AGE AND OVER ENGAGED IN EACH GENERAL DIVISION OF OCCUPATIONS, BY DIVISIONS AND STATES: 1910.

PROPORTION OF MALES AND OF FEMALES 10 YEARS OF AGE AND OVER ENGAGED IN GAINFUL OCCUPATIONS, BY STATES: 1910 AND 1900.

PROPORTION OF MALES AND OF FEMALES 10 YEARS OF AGE AND OVER ENGAGED IN CERTAIN GAINFUL OCCUPATIONS: 1910.

MALES

In the United States as a whole in 1910 females constituted 17.1 per cent of the persons engaged in manufacturing and mechanical industries, but this proportion ranged from 8.8 per cent in the Pacific to 24.6 per cent in the New England division. The proportion which females constitute of all persons engaged in manufacturing and mechanical industries in any area is dependent largely upon the nature of these industries. For example, the low proportion of females in manufacturing and mechanical industries in Maine and in Vermont, as contrasted with the other states of the New England division, probably is accounted for partly by the fact that in these two states a smaller proportion of the females were gainfully occupied, but largely by the fact that in these two states textile and other industries which give suitable employment to females are far less prominent than in the other New England states. The large proportion of females in manufacturing and mechanical industries in New Mexico and in Arizona, as compared with the other states of the Mountain division, was due mainly to the large number of Indian female blanket and cloth weavers in these two states.

Females constituted but 4 per cent of the persons engaged in transportation, the proportion varying from 2.6 per cent in the South Atlantic to 5.1 per cent in the East North Central division, and from 1 per cent in Wyoming to 5.7 per cent in Michigan. More than eight out of ten (82.8 per cent) of the females engaged in transportation were telephone operators; and female telephone and telegraph operators combined formed nine out of ten (90.5 per cent) of the females engaged in transportation. Likewise in each state a very large majority of the females engaged in transportation in 1910 were telephone and telegraph operators.

More than one-eighth (12.9 per cent) of the persons engaged in trade in the United States in 1910 were females, the proportion ranging from 9 per cent in the West South Central to 14.9 per cent in the East North Central division, and from 7.7 per cent in North Dakota to 18.1 per cent in Delaware. The proportion was high also in Massachusetts, Pennsylvania, Ohio, Illinois, Wisconsin, Maryland, and the District of Columbia. Of all the females engaged in trade in the United States considerably more than one-half (53.5 per cent) were saleswomen in stores; and saleswomen in stores, clerks in stores, and retail dealers combined formed over nine-tenths (91.7 per cent) of the females engaged in trade. In each of the states also these three occupations gave employment to a very large proportion of all females engaged in trade.

In 1910 females constituted 3 per cent of all persons engaged in the pursuits classified under public service.

This proportion varied from 1.7 per cent in the Middle Atlantic to 5 per cent in the Mountain division, and from seven-tenths of 1 per cent in Rhode Island and 1.3 per cent in New Jersey to 11.3 per cent in North Dakota and to 14 per cent in Idaho. The high proportion in North Dakota and Idaho, respectively, was due to the large proportion which female postmistresses constituted of all persons engaged in public service in each of these states in 1910. In the United States not far from two-thirds (64.3 per cent), and in most of the states considerably over one-half of the females engaged in the pursuits here classified under public service were postmistresses.

Of the persons engaged in professional service in 1910, 55.9 per cent were males and 44.1 per cent were females. In no other general division of occupations, except domestic and personal service, did the females form so large a proportion of the workers. The high pro-

portion of females engaged in professional service was due to the large number of female musicians and teachers of music, school teachers, and trained nurses, the excess of females over males in these three occupations being 458,757. More than six out of seven of the females engaged in professional service in 1910 were in these three occupations. The proportion which females constituted of all persons engaged in professional service ranged from 39.1 per cent in the West South Central to 51.3 per cent in the West North Central division, and from 28.9 per cent in Nevada to 58 per cent in Iowa. In 10 different states-Maine, New Hampshire, Vermont, Wisconsin, Minnesota, Iowa, North Dakota, South Dakota, Nebraska, and Kansas-the number of females engaged in professional service in 1910 exceeded the number of males. This is explained mainly by the fact that

the proportion which female musicians and teachers

of music and female school teachers constituted of

the total number was considerably higher in each of

these states than in the United States as a whole.

More than two-thirds of the persons engaged in domestic and personal service in the United States in 1910 were females, and in no other general division of occupations did the females form so large a proportion of the workers. In the South Atlantic and East South Central divisions more than three-fourths of the persons engaged in domestic and personal service were females; and in each of six different states in these two geographic divisions, and in the state of Vermont. females constituted over four-fifths of the persons engaged in this class of work. In the Pacific division, however, females constituted less than half the persons in this general division of occupations, and in Nevada the proportion of females was less than two-fifths. This low proportion in Nevada is accounted for in part by the small proportion which females constituted of all persons gainfully occupied in the state in 1910, 9.7 per cent, as compared with a proportion of 21.2 per cent for the females of the entire United States.

¹ Clerical pursuits in public service were classified with corresponding clerical pursuits under "Clerical occupations,"

Females constituted somewhat over one-third of the persons engaged in clerical occupations in the United States in 1910, the proportion ranging from 22.3 per cent in the West South Central division to 43.1 per cent in New England, and from 17.4 per cent in Louisiana to 46 per cent in Maine.

Outlying territories.—The following table shows for Alaska, Hawaii, and Porto Rico, for all occupations and for each general division of occupations, the number of males and of females engaged in gainful occupations in 1910 and the per cent which the workers of each sex constituted of the total:

| Trade Public service (not elsewhere classified) | 25,579 | | 96.4 | 912 | 3. |
| Public service (not elsewhere classified) | 3,535 $4,275$ | 3,538 2,778 | 98.7 65.0 | 1,497 | 35. |
| Professional service Domestic and personal service | 54,960 | | 17.9 | 45, 149 | 82. |
| Clerical occupations | 2,624 | 2,435 | 92.8 | 189 | 7. |

Table 19 shows that in Alaska in 1910, 95.7 per cent of the gainful workers were males, and that the males

constituted over nine out of ten of the workers in every general division of occupations except professional service, where they constituted eight out of ten of the workers. Even in domestic and personal service nine out of ten of the workers were males. The females constituted 20.6 per cent of the persons in professional service, 9.9 per cent of the persons in domestic and personal service, 9.4 per cent of the persons in clerical occupations, 6.8 per cent of the persons in manufacturing and mechanical industries, and 4.7 per cent of the persons in trade; but in none of the other branches of occupations did they constitute so large a proportion as 1 per cent of the workers. In each general division of occupations except extraction of minerals, females constituted a much smaller proportion of the workers in Alaska than in the United States.1

In Hawaii in 1910, 88.9 per cent of the gainful workers were males, and in each general division of occupations, except professional service and domestic and personal service, from 90 to 100 per cent of the workers were males. Females constituted 40 per cent of the persons in domestic and personal service, 36.3 per cent of the persons in professional service, and 10.2 per cent of the persons in clerical occupations. In each general division of occupations the females constituted a larger proportion of the workers in the United States ¹ than in Hawaii.

In Porto Rico in 1910, over eight out of ten of the gainful workers were males, and except in manufacturing and mechanical industries, professional service, and domestic and personal service, males constituted over nine out of ten of the workers in each main branch of occupations. Females constituted 34.3 per cent of the workers in manufacturing and mechanical industries, 35 per cent of the workers in professional service, and 82.1 per cent of the workers in domestic and personal service. In manufacturing and mechanical industries and in domestic and personal service females constituted a larger proportion of the workers in Porto Rico than in the United States,1 but in each of the other main branches of occupations females constituted a larger proportion of the workers in the United States 1 than in Porto Rico.

¹ See Table 16, p. 57.

PERSONS OCCUPIED DISTRIBUTED BY COLOR OR RACE, NATIVITY, AND PARENTAGE.

United States.—Table 20 (p. 64) shows, for the United States and for each of its geographic divisions, a distribution by color or race, nativity, and parentage of the population 10 years of age and over and of the persons engaged in gainful occupations in 1910.

This table shows that in the United States in 1910 the foreign-born whites and the negroes each constituted a larger per cent, and that each of the native white classes constituted a smaller per cent of the persons engaged in gainful occupations than it did of

the population 10 years of age and over. The only exceptions to this relationship in the geographic divisions were that in the East North Central division the native whites of foreign or mixed parentage constituted a larger proportion of the gainful workers than of the population 10 years of age and over, and that in the East South Central division the foreign-born whites constituted the same proportion of the gainful workers as of the population 10 years of age and over. Only in the Mountain division and in the Pacific divi-

sion did the persons included in the Indian, Chinese, Japanese, and "all other" group constitute an important proportion of the population 10 years of age and latter than of the former.

over or of the gainful workers, but in each of these divisions they constituted a larger proportion of the latter than of the former.

| NegroIndlan, Chinese, Japanese, and all other | 0.3 | 0.3 | 0.2 | U. 2 |

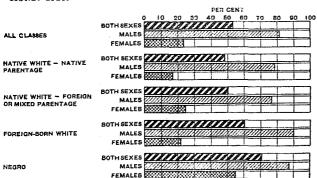

This summary shows for both sexes that in 1910 the native whites of native parentage and the negroes each constituted a smaller proportion both of the population 10 years of age and over and of the persons engaged in gainful occupations than in 1900; and that in 1910 the native whites of foreign or mixed parentage and the foreign-born whites each constituted a larger proportion both of the population 10 years of age and over and of the persons engaged in gainful occupations than in 1900. The relationship between the proportions for the respective classes was the same for the males as for both sexes. In case of the females, however, the native whites of native parentage and the negroes each constituted in 1910 a smaller proportion of all females 10 years of age and over but a larger proportion of the gainfully occupied females than in 1900. The native white females of foreign or mixed parentage in 1910 formed a larger proportion of all females 10 years of age and over but a smaller proportion of the gainfully occupied females than in 1900; and the foreign-born white females in 1910 formed the same proportion of all females 10 years of age and over but a smaller proportion of the gainfully occupied females than in 1900.

The following summary for the United States shows, for each principal class of the population, the proportion which the persons of both sexes and of each sex engaged in gainful occupations constituted of all persons of the same sex or class 10 years of age and over, in 1910 and in 1900, respectively.

| Table 22 | | 1910 | | 1900 | | | | |
|--|----------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--|--|
| CLASS OF POPULATION. | Both sexes. | Male. | Fe- male. | Both sexes. | Male. | Fe- nale. | | |
| All classes | 53.3 | 81.3 | 23.4 | 50.2 | 89.0 | 18. 8 | | |
| Native white—Native parentage Native white—Foreign or mixed par Foreign-born white | 60.3 71.0 | 78.5 76.5 90.0 87.4 80.8 | 17.1 24.6 21.7 54.7 17.6 | 45.8 48.5 57.3 62.2 59.2 | 77.3 75.4 89.7 84.1 80.0 | 13.0 21.7 19.1 40.7 14.2 | | |

This summary shows that in the total population and in each class of the population a larger proportion of the persons 10 years of age and over was engaged in gainful occupations in 1910 than in 1900, the increase being especially marked for the negroes. Likewise, in case of each sex, the proportion of the persons 10 years of age and over engaged in gainful occupations was larger in each class of the population in 1910 than in 1900, the increase being greatest for the negroes, and especially great in case of the negro females. For both the males and the females the rank of the principal classes of the population in accordance with the proportion of the population 10 years of age and over engaged in gainful occupations was the same in 1910 as in 1900. The proportion of gainful workers in each principal class of the population in 1910 is also shown graphically in the following diagram:

PROPORTION OF EACH PRINCIPAL CLASS OF THE POPULATION 10 YEARS OF AGE AND OVER ENGAGED IN GAINFUL OCCUPATIONS: 1910.

Divisions and states.—The proportion which the number of gainfully occupied males in each principal class of the population in 1910 constituted of all males 10 years of age and over in the same class is shown, for each geographic division and for each state, in Table 23 (p. 66).

This table shows, that in the United States as a whole in 1910, 78.5 per cent of the native white males

of native parentage 10 years of age and over were engaged in gainful occupations, but that the proportion varied in the geographic divisions from 75.5 per cent in the East North Central to 83.4 per cent in the East South Central division, and in the states from only 65.7 per cent in Wisconsin to 86.8 per cent in Alabama. The proportion of the native white males of foreign or mixed parentage 10 years of age and over gainfully occupied in 1910 was 76.5 per cent in the entire United States, but ranged in the geographic divisions from 72.1 per cent in New England to 84.6 per cent in the East South Central division, and in the states from 69.5 per cent in New Hampshire to 87.1 per cent in Kentucky. Of the foreign-born white males 10 years of age and over in the United States in 1910, 90 per cent were gainful workers. In the geographic divisions, the proportion was lowest in the West North Central division, 87.3 per cent, and highest in the Mountain division, 92.7 per cent. In each geographic division the proportion was higher for the foreign-born white males than for the males of either of the native white classes, and in each of the geographic divisions, except the East South Central, the proportion was higher for the foreign-born white than for the negro males. Next to the foreign-born whites, the negroes had the highest proportion of gainful workers in the male population 10 years of age and over in 1910. This proportion was 87.4 per cent for the United States as a whole, but in the geographic divisions varied from 84.2 per cent in the West North Central to 89.3 per cent in the Pacific division, and in the states from 79,2 per cent in Kansas to 96.9 per cent in Maine.

Table 24 (p. 67) shows, for each geographic division and for each state, the proportion which the number of gainfully occupied females in each principal class of the population in 1910 constituted of all females 10 years of age and over in the same class.

According to Table 24, 17.1 per cent of the native white females of native parentage 10 years of age and over in the United States in 1910 were engaged in gainful occupations. This proportion varied in the geographic divisions from 14.2 per cent in the West North Central to 22.7 per cent in the New England division, and in the states from 11.6 per cent in West Virginia to 27.3 per cent in South Carolina. The proportion of the native white females of foreign or mixed parentage gainfully occupied in 1910 was 24.6 per cent in the United States as a whole, but varied in the geographic divisions from 17.1 per cent in the Mountain to 35.1 per cent in the New England division; and in the states from 12.8 per cent in Oklahoma to 38.7 per cent in Rhode Island. In each geographic division the proportion was higher for the native white females of foreign or mixed parentage than for either the native white females of native parentage or the foreign-born white females.

NUMBER AND PROPORTION OF MALES IN EACH PRINCIPAL CLASS OF THE POPULATION 10 YEARS OF AGE AND OVER ENGAGED IN GAINFUL OCCUPATIONS, BY DIVISIONS AND STATES: 1910.

Of the foreign-born white females 10 years of age and over in the United States in 1910, 21.7 per cent were gainfully occupied, the proportion varying in the geographic divisions from 13.8 per cent in the West North Central to 30.9 per cent in the New England division, and in the states from 9.5 per cent in Kansas to 34.4 per cent in New Hampshire. In general, the proportion was much higher in the manufacturing states than in the agricultural states, but contrary to this general rule the proportion was high in Maine, Vermont, South Carolina, Florida, Mississippi, Texas, and Nevada. The proportion of the negro females 10 years of age and over engaged in gainful occupations in 1910 was considerably more than double the proportion for either of the other principal classes of the female population. This proportion was 54.7 per cent for the entire United States, but varied in the geographic divisions from 38.7 per cent in the East North Central to 61 per cent in the East South Central division, and in the states from 29.6 per cent in Kansas to 68.5 per cent in Mississippi.

Outlying territories.—Table 25 shows, for Alaska, Hawaii, and Porto Rico, a distribution by color or race, nativity, and parentage of the population 10 years of age and over and of the persons engaged in

gainful occupations in 1910.

In Alaska, as shown by Table 25, over two-fifths (41.3 per cent) of the gainful workers in 1910 were foreign-born white persons, over one-fifth (20.3 per cent) were Indians, and almost one-fifth (19.6 per cent) were native white persons of native parentage. Native white persons of foreign or mixed parentage constituted one-eighth (12.5 per cent) and Chinese, Japanese, negro, and all other constituted onesixteenth (6.3 per cent) of the gainful workers. Indians formed almost one-third of the population 10 years of age and over, but only slightly over onefifth of the gainful workers. Each of the other classes of the population, however, formed a larger proportion of the gainful workers than of the population, the excess being most marked in case of the foreign-born whites.

1 Less than one-tenth of 1 per cent.

In Hawaii 50.9 per cent—over one-half—of the gainful workers in 1910 were Japanese. The Hawaiians and the part Hawaiians combined constituted 11.3 per cent, the Caucasians 17.7 per cent, the Chinese 13.9 per cent, and all others 6.2 per cent of the gainful workers. The Hawaiian, the part Hawaiian, and the Caucasian elements each constituted a much smaller proportion of the gainful workers than of the population 10 years of age and over, but the reverse was true of the Chinese and of the Japanese element.

In Porto Rico native white persons of native parentage formed 59.2 per cent of the gainful workers in 1910, negroes 36.6 per cent, and all other persons only 4.3 per cent. The native whites of native parentage and the native whites of foreign or mixed parentage each constituted a smaller proportion of the gainful workers than of the population 10 years of age and over, but the foreign-born whites and the negroes each constituted a larger proportion of the gainful workers than of the population.

PERSONS OCCUPIED DISTRIBUTED BY AGE PERIODS.

United States.—In the tabulation of occupations for this report, all gainful workers were distributed into the following five age periods: 10 to 13, 14 to 15, 16 to 20, 21 to 44 and unknown, and 45 years and over. Table 26 (p. 69) shows for the males and for the females the number of persons of each specified age engaged in gainful occupations compared with the total number of the same age in 1910 and in 1900.

Table 26 shows that in the United States in 1910 more than eight in every ten (81.3 per cent) males 10 years of age and over were engaged in gainful occupations. In the lowest age period, 10 to 13, the proportion was one in six (16.6 per cent); in the next

age period, 14 to 15, the proportion more than doubled, being over two in each five (41.4 per cent); and in the age period 16 to 20 the proportion increased to almost four in five (79.2 per cent). The proportion was highest for the age period 21 to 44 (including persons of unknown age). In this age period 96.7 per cent of the males were gainfully occupied; or, stated otherwise, only 3.3 men out of every 100 in this age period were without gainful occupations in 1910. In the highest age period, 45 years and over, the proportion of males gainfully occupied in 1910 dropped to 85.9 per cent. If the two highest age periods be combined, it is found that of all the males 21 years of

age and over in the United States in 1910 considerably over nine out of every ten (93.1 per cent) were engaged in gainful occupations.

¹ Includes persons of unknown age.

The proportion of all males 10 years of age and over engaged in gainful occupations was slightly larger in 1910 than in 1900. However, this increase was confined to two age periods, 16 to 20 and 21 to 44. In each of the other three age periods the proportion of gainful workers was smaller in 1910 than in 1900, the decrease being greatest for the age period 14 to 15.

Of the females 10 years of age and over in the United States in 1910, 23.4 per cent were engaged in gainful occupations. In each of the first three age periods-10 to 13, 14 to 15, and 16 to 20-the proportion of gainful workers was approximately only half as large for the females as for the males. In case of the males the highest proportion of gainful workers was in the age period 21 to 44 and the next highest in the age period 45 years and over; but in case of the females the highest proportion of gainful workers was in the age period 16 to 20 (39.9 per cent) and the next highest in the age period 21 to 44 (26.3 per cent), while the proportion in the age period 45 years and over (15.7 per cent) was smaller than in the age period 14 to 15 (19.8 per cent). The large proportion of the females 16 to 20 years of age engaged in gainful occupations is accounted for by the fact that in this age period all the females are old enough to work and matrimony has had little effect in decreasing the number of workers. The proportion of gainful workers of each sex in each specified age is also shown graphically for 1910 in the diagram in the next column.

There was a marked increase from 1900 to 1910 in the proportion of all females 10 years of age and over engaged in gainful occupations, the respective percentages being 18.8 and 23.4. In each age period also the proportion of gainful workers was considerably larger in 1910 than in 1900, and, as was true also of the males, the increase was most marked for the age period 16 to 20.

Proportion of Males and of Females of Each Specified Age Engaged in Gainful Occupations: 1910.

¹ Includes persons of unknown age.

According to this summary, in 1910 more than 8 out of 10 (80.5 per cent) of the gainful workers in the United States were 21 years of age and over, and almost 95 out of every 100 (94.8 per cent) were 16 years of age and over. Children 10 to 13 years of age constituted 2.3 per cent, children 14 to 15 years of age constituted 2.9 per cent, or combining the two groups -children 10 to 15 years of age constituted 5.2 per cent of all gainful workers. In each of the three lower age periods the proportion of the male workers was smaller than that of the females, and in each of the two higher age periods it was larger. While the male workers 10 to 15 years of age constituted 4.5 per cent of all male workers, the female workers 10 to 15 years of age constituted 7.9 per cent of all female workers; and while the male workers 45 years of age and over constituted 26.1 per cent of all male workers, the female workers 45 years of age and over constituted only 16 per cent of all female workers. The distribution of gainful workers in 1910 according to specified ages is shown graphically, for both sexes and for each sex separately, in the diagram on the next page.

In 1900 the proportion of the gainful workers in each of the first two age periods—10 to 13 and 14 to 15 years—and in the last age period—45 years and over—was larger, and the proportion in each of the two

remaining age periods was smaller than in 1910. As a result the proportion which children 10 to 15 years of age constituted of all gainful workers decreased from 6 per cent in 1900 to 5.2 per cent in 1910. For the males the decrease was from 5.4 per cent in 1900 to 4.5 per cent in 1910, and for the females it was from 9.2 per cent in 1900 to 7.9 per cent in 1910. The proportion of occupied females in the age period 16 to 20 was also smaller in 1910 than in 1900, the respective percentages being 22.9 and 23.3.

PROPORTION WHICH THE GAINFUL WORKERS OF EACH SPECIFIED AGE CONSTITUTED OF ALL GAINFUL WORKERS: 1910.

In the following summary for the United States the number of children of each sex, 10 to 15 years of age, engaged in gainful occupations is compared with the total number of children of the same sex and age in 1910, 1900, and 1880:

| Table 28 | CHILDREN 10 | TO 15 YEARS | OF AGE. | | | |
|----------------------|--|---------------------------------|----------------|--|--|--|
| CENSUS YEAR AND SEX. | Total number. | Engaged in gainful occupations. | | | | |
| | number. | Number. | Per cent. | | | |
| 1910 | | | | | | |
| Both sexes | 10,828,365 | 1,990,225 | 18.4 | | | |
| Male | 5,464,228 5,364,137 | 1,353,139 637,086 | 24.8 11.9 | | | |
| 1900 | l de la companya de l | | | | | |
| Both seres | 9,613,252 | 1,750,178 | 13.2 | | | |
| Male Female | 4,852,427 4,760,825 | 1,264,411 485,767 | 26. 1 10. 2 | | | |
| 1880 | ` | | | | | |
| Both seres | 6,649,483 | 1,118,356 | 16.8 | | | |
| MaleFemale | 3,376,114 3,273,369 | 825, 187 293, 169 | 24. 4 9. 0 | | | |

These figures show that, while there was a slight increase from 1900 to 1910 in the proportion of all children 10 to 15 years of age engaged in gainful occupations, this increase came entirely from the increase in the proportion of gainfully occupied females 10 to 15 years of age, since there was a decrease from 1900 to 1910 in the proportion of the males 10 to 15 years of age engaged in gainful occupations. In the next summary children 10 to 15 years of age engaged in gainful occupations in the United States, in 1910 and in 1900, are divided into two broad occupational

groups — agricultural pursuits and nonagricultural pursuits:

| Table 29 SEX AND CENSUS YEAR. | CHILDREN 10 GAGED IN | TO 15 YEARS O GAINFUL OCCUI | F AGE EN- |
|--------------------------------|-------------------------|--------------------------------|-----------------------------------|
| SEA AND CENSUS ILAR. | All occupations. | Agricultural pursuits. | Nonagri- cultural pursuits, |
| BOTH SEXES. | 1,990,225 | 1,431,254 | 558,971 |
| 1910 | 1,750,178 | 1,001,971 | 688,207 |
| 1910 MALE. | 1,353,139 | 1,021,084 | 332,055 |
| 1909 | 1,264,411 | 854,690 | 409,721 |
| 1910 FEMALE. | 637,086 | 410,170 | 226,91 6 |
| 1900 | 485,767 | 207,281 | 278,486 |

This summary shows that the increase from 1900 to 1910 in the number, and hence in the proportion, of all children 10 to 15 years of age engaged in gainful occupations was confined to children engaged in agricultural pursuits, where the increase was 369,283, or 34.8 per cent, for both sexes, 166,394, or 19.5 per cent, for the males, and 202,889, or 97.9 per cent, for the females.1 There was a marked decrease from 1900 to 1910 in the number of children 10 to 15 years of age engaged in nonagricultural pursuits, the decrease being 129,236, or 18.8 per cent, for both sexes, 77,666, or 19 per cent, for males, and 51,570, or 18.5 per cent, for females. Furthermore, the proportion which children 10 to 15 years of age engaged in nonagricultural pursuits constituted of all children 10 to 15 years of age was considerably smaller in 1910 than in 1900, the respective percentages being 5.2 and 7.2 for both sexes, 6.1 and 8.4 for the males, and 4.2 and 5.8 for the females.

Divisions and states.—Table 30 (p. 71) shows for each geographic division and for each state the percent which the males of each specified age engaged in gainful occupations formed of all males of the same age in 1910.

This table shows that in the United States, in 1910, 16.6 per cent—one in six—of the males 10 to 13 years of age were engaged in gainful occupations, but that this proportion varied from only 1.6 per cent in New England to 42.6 per cent in the East South Central division. The proportion was very high, also, in the South Atlantic division (35.1 per cent) and in the West South Central division (33.9 per cent). In these two geographic divisions more than one in three, and in the East South Central division more than two in five, of the males 10 to 13 years of age were engaged in gainful labor in 1910. The highest proportion in any other geographic division was less than one in ten (9 per cent), in the West North Central division. Also, between the different states of each geographic division, except the Pacific, there was a wide variation in the proportion of the males 10 to 13 years of age engaged in gainful occupations in 1910.

¹ See p. 28 for a discussion as to a possible excess in the number of children returned as engaged in agricultural pursuits in 1910.

This proportion varied in the South Atlantic division (excluding the District of Columbia) from 10.2 per cent in Maryland to 50.6 per cent in South Carolina; and in the East South Central division from 26 per cent in Kentucky to 56.1 per cent in Mississippi, where the proportion was larger than in any other state. In the West South Central division the variation was from 24.4 per cent in Oklahoma to 49.2 per cent in Arkansas; and in the Mountain division the variation was from 3.3 per cent in New Mexico.

Of the males 14 to 15 years of age 41.4 per cent more than two in five-were engaged in gainful occupations in 1910, the proportion ranging all the way from 18.5 per cent in the Pacific to 67 per cent in the East South Central division. In the South Atlantic, the East South Central, and the West South Central divisions combined three in every five (61.1 per cent) of the males 14 to 15 years of age were engaged in gainful occupations in 1910. In New England the proportion varied from 23 per cent in Maine to 43.4 per cent in Rhode Island, and in the West North Central division from 23.6 per cent in Minnesota to 42.1 per cent in Missouri. In the South Atlantic division (excepting the District of Columbia) the variation was from 42.3 per cent in Delaware to 74.4 per cent in South Carolina; in the East South Central division from 54.3 per cent in Kentucky to 77.9 per cent in Mississippi, where the proportion was higher than in any other state; and in the West South Central division from 46.1 per cent in Oklahoma to 68.9 per cent in Arkansas.

In the age period 16 to 20, 79.2 per cent—almost four in every five-of the males were engaged in gainful occupations in 1910, the proportion varying from 71.1 per cent in the Mountain division to 84.7 per cent in the East South Central division. In the states which comprise the respective geographic divisions, the variation in the proportion of the males gainfully occupied was much less for the age period 16 to 20 than for either of the two lower age periods. However, the proportion of males 16 to 20 years of age engaged in gainful occupations in 1910 was large in Rhode Island, Arkansas, and Wyoming, and small in Maine, Vermont, and Oklahoma, as compared with the proportion in the respective geographic divisions to which these different states belong. The proportion was small, also, in the District of Columbia.

The most striking thing about the age period 21 to 44 years —aside from the fact that only 3.3 per cent of the males in it were without gainful occupation in 1910—is the slight variation from one area to another in the proportion gainfully occupied. This proportion was 96.7 per cent for the entire United States, and, in the different geographic divisions, varied only from 96.2 per cent in the West North Central and Mountain

divisions to 96.8 per cent in the New England and South Atlantic divisions. In the different states (if the District of Columbia be excepted) the variation was only from 94.9 per cent in North Dakota to 97.8 per cent in Mississippi and Wyoming. Thus, regardless of existing differences in localities, in industries, in nativity and color, and in economic well being, in no state, in 1910, did the number of gainful workers in every one hundred males 21 to 44 years of age vary more than one and four-fifths from the number for the entire United States—96.7.

Of the males 45 years of age and over 85.9 per cent were engaged in gainful occupations in 1910, the proportion varying from 82.2 per cent in the West North Central to 91.1 per cent in the East South Central division, and from 77.8 per cent in Iowa to 94 per cent in Mississippi. In the states of each respective geographic division, however, the variation was small, being greatest in the West North Central division, where the proportion was 77.8 per cent in Iowa and 85.9 per cent in Missouri.

In each of the five age periods shown in Table 30, the proportion of the males engaged in gainful occupations in 1910 was larger in the East South Central than in any other geographic division, and, except in the age period 16 to 20, larger in Mississippi than in any other state.

Table 31 (p. 73) shows, for each geographic division and for each state, the per cent which the females of each specified age engaged in gainful occupations formed of all females of the same age in 1910.

According to Table 31, 8 per cent of the females 10 to 13 years of age in the United States in 1910 were engaged in gainful occupations. In the geographic divisions outside of the South, this proportion was very small, varying from only four-tenths of 1 per cent in New England to 1.3 per cent in the Mountain division. In the West South Central division, however, 18.1 per cent, in the South Atlantic division 20.1 per cent, and in the East South Central division 22.8 per cent of the females 10 to 13 years of age were engaged in gainful occupations in 1910. In these three geographic divisions combined, the proportion was 20.3 per cent-one in five—as contrasted with a proportion of only eighttenths of 1 per cent for the remainder of the United States. Outside of the South in only eight states was the proportion as high as 1 per cent, being lowest in Massachusetts, three-tenths of 1 per cent, and highest in New Mexico, 2.9 per cent; but in the states comprising the three southern divisions the proportion ranged (if the District of Columbia be excluded) all the way from 2.4 per cent in West Virginia to 39.5 per cent in South Carolina. In 6 of these 16 states over onefourth of the females 10 to 13 years of age were gainfully occupied in 1910, and in 3 of them the proportion far exceeded one-third.

¹ Includes males of unknown age.

¹ Includes females of unknown age.

Of the females 14 to 15 years of age 18 8 per cent were engaged in gainful occupations in 1910. The proportion was low in the West North Central division (7.1 per cent), in the Mountain division (5.3 per cent), and in the Pacific division (5.6 per cent), and was high in New England (22.5 per cent), in the South Atlantic division (33.3 per cent), in the East South Central division (32.5 per cent), and in the West South Central division (26.4 per cent). As compared with the proportion for the entire New England division, the proportion of females 14 to 15 years of age engaged in gainful occupations was low in Maine and in Vermont and high in Rhode Island. Similarly compared, in the South Atlantic division the proportion was high in North Carolina, South Carolina, and Georgia and low in the remaining states; in the East South Central division the proportion was low in Kentucky and Tennessee, and high in Alabama and Mississippi; and in the West South Central division the proportion was low in Oklahoma and high in Arkansas.

In the age period 16 to 20, 39.9 per cent of the females were gainfully occupied in 1910, the proportion ranging from 22.3 per cent in the Mountain division to 56.9 per cent in New England. In the United States and in each geographic division the proportion of the females gainfully occupied was highest in this age period. The proportion was low in Maine (39 per cent) and in Vermont (37.7 per cent) and high in Rhode Island (66.9 per cent), as compared with the proportion for the New England division; low in Pennsylvania, as compared with New York and New Jersey; and low in Indiana, as compared with the other East North Central states. In the West North Central division the proportion was low in Kansas and high in Minnesota, as compared with the proportion in the other states. The proportion was low in Virginia, West Virginia, and Florida, and high in South Carolina, as compared with the proportion for the entire South Atlantic division. In the East South Central division the proportion was much lower in Kentucky and Tennessee than in Alabama and Mississippi; in the West South Central division the proportion was low in Oklahoma; and in the Mountain division the proportion was low in New Mexico.

Of the females 21 to 44 years of age 126.3 per cent were engaged in gainful occupations in 1910. The proportion was high in New England (35.1 per cent), in the South Atlantic division (33.3 per cent), and in the East South Central division (32.8 per cent), and was low in the West North Central division (19.7 per cent) and in the Mountain division (19.2 per cent). In this age period, the proportion of the females engaged in gainful labor varied less among the different states of the

respective geographic divisions than in any of the three preceding age periods. However, the proportion was low in Maine and in Vermont as contrasted with the other New England states, low in West Virginia as contrasted with the District of Columbia and with South Carolina, low in Kentucky as contrasted with Mississippi, and low in Oklahoma as contrasted with Louisiana.

While in the United States as a whole 15.7 per cent of the females 45 years of age and over were engaged in gainful occupations in 1910, the proportion ranged from 10.4 per cent in the West North Central division to 24.5 per cent in the South Atlantic and to 25.2 per cent in the East South Central. In the states the proportion was lowest in Nebraska (9.1 per cent) and highest in Mississippi (38.7 per cent). The proportion was low in Delaware and in West Virginia and high in South Carolina, as contrasted with the proportion for the entire South Atlantic division; low in Kentucky and in Tennessee as contrasted with Alabama and Mississippi; and low in Oklahoma as contrasted with the other states of the West South Central division.

The number of children of each sex 10 to 15 years of age engaged in gainful occupations in 1910 and in 1900, and the proportion which they formed of the total number of children of the same sex and age, are shown for each geographic division and for each state in Table 32 (p. 75).

The proportion of gainful workers 10 to 13 and 14 to 15 years of age, respectively, in each state in the United States in 1910 is shown graphically in the two diagrams on page 76, the figures upon which they are based being given in Tables 30 (p. 71) and 31 (p. 73).

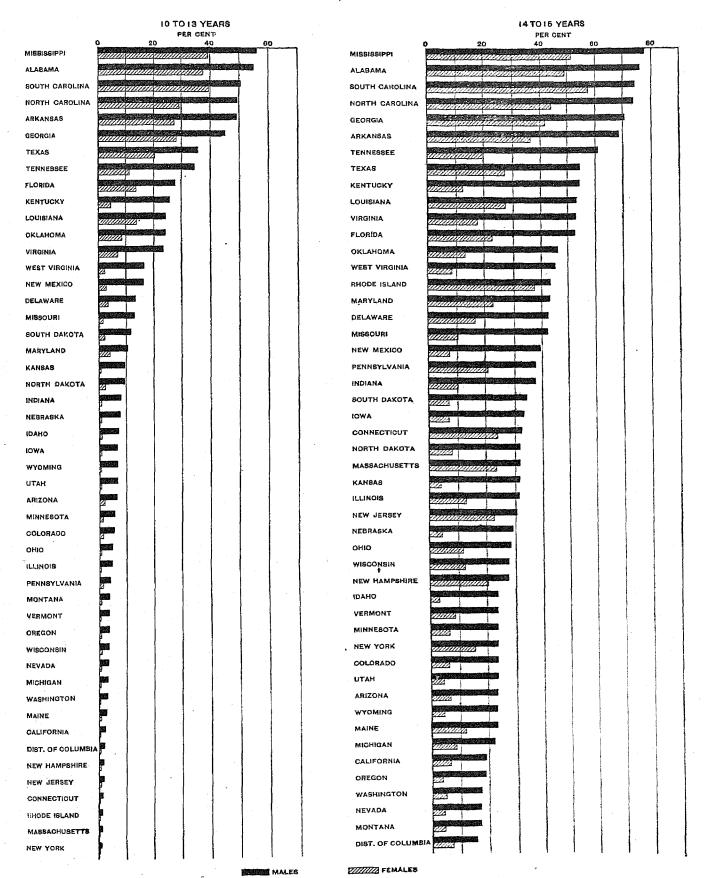

Table 32 shows that in the United States as a whole in 1910, 24.8 per cent of the males and 11.9 per cent of the females 10 to 15 years of age were engaged in gainful occupations. The proportion varied for the males from 8.1 per cent in the Pacific to 50.6 per cent in the East South Central division, and for the females from 2.2 per cent in the Pacific to 26 per cent in the East South Central division. The proportion was very high also in the South Atlantic division (43.6 per cent for the males and 24.4 per cent for the females), and in the West South Central division (40.8 per cent for the males and 20.8 per cent for the females). If the three southern divisions be combined into one group and the remaining divisions into another, it develops that in the South 44.8 per cent of the males and 23.8 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910, as contrasted with a proportion of only 12.9 per cent for the males and 5 per cent for the females in this age period in the remainder of the United States.

¹ Includes females of unknown age.

PROPORTION OF MALES AND OF FEMALES 10 TO 13 AND 14 TO 15 YEARS OF AGE ENGAGED IN GAINFUL OCCUPATIONS, BY STATES: 1910.

While it is a fact, as shown in Table 32, that in 1910 the proportion of children 10 to 15 years of age engaged in gainful occupations was far larger in the South than in any other section of the United States, it is also a fact, as shown by the following table, that a far larger proportion of the gainfully occupied children 10 to 15 years of age were engaged in agriculture, forestry, and animal husbandry in the agricultural states of the South than in the manufacturing states of the North.

This table shows that Vermont was the only one of the selected northern states in which as large a proportion as one-half of the gainfully occupied males 10 to 15 years of age was engaged in agriculture, forestry, and animal husbandry in 1910, and that in Rhode Island the proportion engaged in this branch of occupations was only 5 per cent. In each selected southern state, on the other hand, over threefourths of the gainfully occupied males 10 to 15 years of age were engaged in this branch of occupations in 1910, and in Mississippi the proportion reached 94.9 per cent. Likewise, Pennsylvania was the only selected northern state in which as large a proportion as 4.3 per cent of the gainfully occupied females 10 to 15 years of age was engaged in agriculture, forestry, and animal husbandry in 1910, and in Massachusetts and Rhode Island the proportion was only threetenths of 1 per cent. But in each selected southern state considerably more than one-half of the gainfully occupied females 10 to 15 years of age were engaged in this branch of occupations in 1910, and in Mississippi the proportion reached 95.8 per cent. Notwithstanding the fact that in each of these selected southern states, a large per cent of the gainfully occupied children 10 to 15 years of age were engaged in agriculture, forestry, and animal husbandry, it should be observed that the number engaged in other pursuits was large in each state.

In the United States as a whole (see Table 32), the proportion of the males 10 to 15 years of age engaged in gainful occupations decreased from 26.1 per cent in 1900 to 24.8 per cent in 1910, while the proportion of the females 10 to 15 years of age engaged in gainful occupations increased during the same period from 10.2 per cent to 11.9 per cent. But in each geographic division outside of the South there was a decrease from 1900 to 1910 in the proportion both of the males and of the females 10 to 15 years of age engaged in gainful occupations. For each sex the decrease was most marked in the Middle Atlantic division, being from 18.3 per cent in 1900 to 11.5 per cent in 1910 for the males, and from 9.8 per cent in 1900 to 6.8 per cent in 1910 for the females. In each of the three geographic divisions of the South, however, a considerably larger proportion both of the males and of the females' 10 to 15 years of age was gainfully occupied in 1910 than in 1900. For both the males and the females the increase was greatest in the West South Central division—from 37.5 per cent in 1900 to 40.8 per cent in 1910 for males, and from 12.1 per cent in 1900 to 20.8 per cent in 1910 for females.

In the New England division 11.4 per cent of the males and 7.7 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. The proportion in the states varied for the males from 9.6 per cent in Maine to 15.5 per cent in Rhode Island, and for the females from 3.2 per cent in Vermont to 13.2 per cent in Rhode Island. According to the census of manufactures in 1909, Rhode Island led the states in the proportion of the population engaged in manufacturing, and in the per capita value of manufactured products. The textile industry is quite important in the state, and in 1910 large numbers of children 10 to 15 years of age were employed in the textile mills. Probably no other New England state furnished more opportunities for childrenespecially for girls-to find employment. Also, the proportion of foreign born in the age period 10 to 15 was larger in Rhode Island in 1910 than in any other New England state, and, as a rule, a larger proportion of the foreign born than of the native children engage in gainful occupations.

In each of the New England states there was a decrease from 1900 to 1910 in the proportion both of the males and of the females 10 to 15 years of age engaged in gainful occupations, the decrease for each sex being especially marked in Rhode Island—from 23.2 per cent in 1900 to 15.5 per cent in 1910 for the males, and from 17.4 per cent in 1900 to 13.2 per cent in 1910 for the females.

In the Middle Atlantic division 11.5 per cent of the males and 6.8 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. For the males the proportion was considerably higher in Pennsylvania (15.1 per cent) than in New York (8.4 per cent) or New Jersey (11 per cent), but for the females the proportion was highest in New Jersey (8 per cent). In Pennsylvania 501 boys 10 to 13 years of age and 7,576 boys 14 to 15 years of age were working in 1910 at the coal mines, 3,325 of them as "breaker boys." In each Middle Atlantic state there was a decrease from 1900 to 1910 in the proportion of the children 10 to 15 years of age engaged in gainful occupations, the decrease being especially marked in case of the males.

In the East North Central division 13 per cent of the males and 4.3 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. The proportion in the states varied for the males from 9.3 per cent in Michigan to 18 per cent in Indiana, and for the females from 3.1 per cent in Michigan to 4.8 per cent in Wisconsin. The great variation between Michigan and Indiana in the proportion of the males 10 to 15 years of age engaged in gainful occupations in 1910 resulted in part from the proportion of the males 10 to 13 years of age engaged in gainful occupations (Table 30) being much smaller in Michigan (3.1 per cent) than in Indiana (7.9 per cent). In each state of the East North Central division except Indiana, there was a decrease from 1900 to 1910 in the proportion both of the males and of the females 10 to 15 years of age engaged in gainful occupations, the decrease being most marked in Illinois for the males and in Wisconsin for the females. In Indiana the increase in the proportion of the children 10 to 15 years of age engaged in gainful occupations was from 16.5 per cent in 1900 to 18 per cent in 1910 for the males, and from 3.6 per cent in 1900 to 4 per cent in 1910 for the females.

In the West North Central division 17.1 per cent of the males and 3.1 per cent of the females were engaged in gainful occupations in 1910. In the states the proportion for the males was lowest in Minnesota (11.4 per cent) and highest in Missouri (22.7 per cent), while for the females the proportion was lowest in Kansas (1.7 per cent) and highest in Missouri (4.3 per cent). The high proportion in Missouri, as contrasted with that in the other states of this division, is accounted for in part, probably, by the larger proportion of negroes in the population of Missouri. The proportion of the males 10 to 15 years of age engaged in gainful occupations was smaller in 1910 than in 1900 in each state of the West North Central division except North Dakota, where the proportion increased from 14.6 per cent in 1900 to 16.5 per cent in 1910. In each state the proportion of the females 10 to 15 vears of age engaged in gainful occupations was smaller in 1910 than in 1900, the decrease being greatest in Minnesota—from 5.4 per cent in 1900 to 2.9 per cent in 1910.

In the South Atlantic division 43.6 per cent of the males and 24.4 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. In the states of this division (excluding the District of Columbia) the proportion varied greatly, the variation for the males being from 21.1 per cent in Maryland to 58.2 per cent in South Carolina, and for the females from 4.3 per cent in West Virginia to 45.4 per cent in South Carolina. These great variations doubtless are accounted for mainly by differences in the proportion of negroes in this age period, together with the fact that usually a far larger proportion of the negro than of the white children are gainfully occupied. For the tables of this report a separate tabulation by color or race has not yet been made of the Thirteenth Census returns of children engaged in gainful occupations, but the Twelfth Census figures show that in the South Atlantic division, in 1900, the proportion of gainful workers in the age period 10 to 15 was 36.2 per cent for the white males and 50.4 per cent for the negro males, and 10.6 per cent for the white females and 31.1 per cent for the negro females. The proportion of males 10 to 15 years of age engaged in gainful occupations increased from 1900 to 1910 in North Carolina, South Carolina, Georgia, and Florida, the increase being especially marked in Georgia—from 46.7 per cent in 1900 to 53.7 per cent in 1910; but in each of the other states of the division, and in the District of Columbia, there was a decrease from 1900 to 1910 in the proportion of the males in this age period gainfully occupied. In each state of the South Atlantic division except Delaware and Maryland, the proportion of the females 10 to 15 years of age engaged in gainful occupations was larger in 1910 than in 1900, the increase being especially marked in North Carolina and Georgia. In each of these two states the proportion of the females 10 to 15 years of age engaged in gainful occupations was over 10 per cent higher in 1910 than in 1900.

In the East South Central division 50.6 per cent of the males and 26 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. In the states, the proportion varied for the males from 35.3 per cent in Kentucky to 63.2 per cent in Mississippi, and for the females from 7.3 per cent in Kentucky to 43.3 per cent in Mississippi. These variations correspond rather closely to the variations in the proportion of negroes in the population, and doubtless the proportion of the children gainfully occupied was determined in part by the proportion which negro children constituted of the total. In each state of the East South Central division except Kentucky, the proportion of the males 10 to 15 years of age engaged in gainful occupations was larger in

1910 than in 1900; and in each state of the division the proportion of the females 10 to 15 years of age engaged in gainful occupations was larger in 1910 than in 1900, the increase being quite marked in Alabama and in Mississippi.

In the West South Central division 40.8 per cent of the males and 20.8 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. In the states, the proportion varied for the males from 31.5 per cent in Oklahoma to 55.7 per cent in Arkansas, and for the females from 10 per cent in Oklahoma to 30.5 per cent in Arkansas. The low proportion of the children of Oklahoma engaged in gainful occupations, as contrasted with the proportion for each of the other states of this geographic division, probably is accounted for largely by the smaller proportion of negroes in the population of Oklahoma in 1910—8.3 per cent, as contrasted with 22.6 per cent for the entire division. However, in 1910, the proportion of the children of each sex 10 to 15 years of age engaged in gainful occupations was far higher in Arkansas than in Louisiana, notwithstanding the fact that the proportion of negroes in the population was 28.1 per cent in Arkansas and 43.1 per cent in Louisiana. In part this resulted from, though it is not accounted for, by the proportion of the children 10 to 13 years of age engaged in gainful occupations being practically twice as large in Arkansas as in Louisiana. While in 1910 the proportion gainfully occupied was larger for the males in each age period and for the females in each of the first three age periods in Arkansas than it was in Louisiana (Tables 30 and 31), the difference was far greater in the age period 10 to 13 than in either of the higher age periods. From 1900 to 1910 the proportion of the males 10 to 15 years of age engaged in gainful occupations increased in Arkansas and Texas and decreased in Louisiana and Oklahoma, and the proportion of the females 10 to 15 years of age engaged in gainful occupations decreased in Louisiana and increased in Arkansas, Oklahoma, and Texas. The increase for the females was very great in Arkansas—from 15.8 per cent in 1900 to 30.5 per cent in 1910.

In the Mountain division 12.8 per cent of the males and 2.6 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910, the proportion varying for the males from 7.8 per cent in Nevada to 23.7 per cent in New Mexico, and for the females from 1.5 per cent in Idaho to 4.3 per cent in New Mexico. The high proportion for each sex in New Mexico comes in part from the proportion of the children 10 to 13 years of age engaged in gainful occupations in 1910 being much greater in New Mexico than in any other state of the Mountain division (Tables 30 and 31). From 1900 to 1910 the proportion of the children 10 to 15 years of age engaged in gainful occupations increased for the

males in Colorado, New Mexico, and Utah, and decreased in each of the other states of the Mountain division, and for the females increased in Idaho, Colorado, New Mexico, and Nevada and decreased in each of the other states. For each sex the decrease was greatest in Arizona.

In the Pacific division 8.1 per cent of the males and 2.2 per cent of the females 10 to 15 years of age were engaged in gainful occupations in 1910. In no other geographic division was the proportion so small for either sex. In the states of this division, the proportion was highest for the males in Oregon, 8.7 per cent, and highest for the females in California, 2.6 per cent. In each state there was a decrease from 1900 to 1910 in the proportion both of the males and of the females 10 to 15 years of age engaged in gainful occupations.

Outlying territories.—The following table shows for Alaska, Hawaii, and Porto Rico the number of males and of females of each specified age engaged in gainful occupations compared with the total number of the same sex and age in 1910:

| Table 34 | | O YEARS O OVER: 19 | ARS OF AGE FEMALES 10 YEARS R: 1910 AGE AND OVER: 19 | | | |

¹ Includes persons of unknown age.

This table shows that in Alaska in 1910 considerably over nine in every ten (93.3 per cent) of the males 10 years of age and over were engaged in gainful occupations. In the lowest age period, 10 to 13, the proportion was only 5.8 per cent; in the next age period, 14 to 15, the proportion increased to 27.8 per cent—considerably over one in four; and in the age period 16 to 20, the proportion reached 79.8 per cent—four in every five. The proportion was highest in the age period 21 to 44 (98.5 per cent). In the age period 45

years and over the proportion of gainful workers was still very high, 97.3 per cent. The proportion in the first two age periods-10 to 13 and 14 to 15-was conconsiderably smaller in Alaska than in the United States; in the age period 16 to 20 the proportion was practically the same in Alaska as in the United States; in the age period 21 to 44 the proportion was considerably higher in Alaska than in the United States; and in the age period 45 years and over the proportion was very much higher in Alaska than in the United States. Of the females 10 years of age and over in Alaska in 1910, 12.4 per cent were gainfully occupied. As compared with the proportion in the United States,¹ the proportion in Alaska was very small in each age period except the highest; and while in the United States the proportion of gainful workers was highest for the females in the age period 16 to 20, in Alaska the proportion was highest in the age period 45 years and over.

In Hawaii in 1910, 88.8 per cent-almost nine out of ten-of the males 10 years of age and over were engaged in gainful occupations. In the first age period, 10 to 13, the proportion was only 3.5 per cent; in the second age period, 14 to 15, it had jumped to 29.6 per cent, and in the age period 16 to 20 it had further increased to 83.6 per cent. The proportion was highest in the age period 21 to 44 (98.6 per cent); and in the age period 45 years and over more than nine out of ten (91.9 per cent) of the men were still at work. In the first two age periods the proportion of gainful workers was much smaller in Hawaii than in the United States,1 but in each of the other age periods the proportion was higher in Hawaii than in the United States. The proportion of the females 10 years of age and over engaged in gainful occupations in 1910 was slightly higher in Hawaii than in the United States. However, in each of the first three age periods the proportion was very much smaller in Hawaii than in the United States. In the United States the proportion of gainful workers was highest for the females in the age period 16 to 20, but in Hawaii the proportion was highest in the age period 21 to 44.

In Porto Rico in 1910, 82.1 per cent of the males 10 years of age and over were engaged in gainful occupations. The proportion was 22.2 per cent for the age period 10 to 13, 60.9 per cent for the age period 14 to 15, and 89.4 per cent for the age period 16 to 20. The proportion was highest for the age period 21 to 44, 98.6 per cent, and next highest for the age period 45 years and over, 94.2 per cent. For all the age periods combined and for each separate age period the proportion of gainful workers was higher for the males in Porto Rico than in the United States.¹ While the proportion of gainful workers in the male population 10 years of age and over in 1910 was much higher in Hawaii than in Porto Rico, the proportion of gainful workers in each separate age period, except the period

21 to 44, was considerably smaller in Hawaii than in Porto Rico, and the proportion in the age period 21 to 44 was the same in each place. These percentages are explained by the fact that the proportion which boys 10 to 20 years of age constituted of the male population 10 years of age and over in 1910 was only 17.1 per cent in Hawaii, as compared with 36.1 per cent in Porto Rico. Of the females 10 years of age and over in Porto Rico in 1910, 19.5 per cent were engaged in gainful occupations, as compared with a proportion of 23.4 per cent in the United States. In each age period except the highest the proportion was higher in the United States than in Porto Rico, but in the highest age period, 45 years and over, the proportion was much higher in Porto Rico than in the United States.

The following table shows for Alaska, Hawaii, and Porto Rico, for both sexes and for each sex separately, the per cent which the gainful workers in each age period constituted of all gainful workers in 1910.

| Table 35 | PER CENT DISTRIBUTION OF PERSONS ENGAGED IN GAIN- FUL OCCUPATIONS: 1910 | | | | |

¹ Includes persons of unknown age.

According to Table 35, considerably over nine out of ten (94.1 per cent) of the gainful workers of Alaska in 1910 were 21 years of age and over. Children 10 to 15 years of age constituted less than 1 per cent, and young persons 16 to 20 years of age constituted but slightly over 5 per cent of the gainful workers. Persons 10 to 20 years of age constituted a much smaller proportion of the gainful workers in Alaska than in the United States, persons 45 years of age and over the same proportion, and persons 21 to 44 years a much larger proportion. The respective proportions for the males followed very closely the proportions for both sexes. A larger proportion of the female than of the male workers was in the younger age periods, and a smaller proportion in the age period 21 to 44.

In Hawaii in 1910 nine out of ten (89.9 per cent) of the gainful workers were 21 years of age and over. Children 10 to 15 years of age formed only 1.4 per cent, and young persons 16 to 20 years of age formed only 8.7 per cent of the gainful workers. As compared with the United States, the proportion of the workers in the age period 21 to 44 years was very high and the proportion in each of the other age periods was very low. The proportions for the males did not vary much from the proportions for both sexes. Of the female workers almost three-fourths (74 per cent) were in the age period 21 to 44 years. The proportion in this age period was considerably larger and the proportion in each of the other age periods considerably smaller than in the United States.

¹ See Table 27, p. 69.

32446°—14——6

In Porto Rico practically three-fourths (74.7 per cent) of the gainful workers in 1910 were 21 years of age and over. Children 10 to 13 years of age constituted 4.2 per cent, children 14 to 15 years of age constituted 5.4 per cent, and young persons 16 to 20 years of age constituted 15.7 per cent of the gainful workers. As compared with the United States,1 the proportion of the workers in each of the first three age periods was high in Porto Rico, and the proportion in each of the last two age periods was low. The proportions for the males differed little from the proportions for both sexes. A smaller proportion of the female than of the male workers was in the age period 21 to 44, but each of the other age periods contained a larger proportion of the females than of the males.
