EXPLANATION OF TERMS.

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, and similar subjects. When use is made of the statistics for these purposes it is imperative that due attention be given to their limitations, particularly in connection with any attempt to derive from them figures purporting to show average wages, cost of production, or profits.

The census did not cover establishments which were idle during the entire year or for which products were valued at less than \$500, or the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule, the term "establishment" represents a single plant or factory, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept. If, however, the plants constituting an establishment as thus defined were not all located within the same city, county, or state, separate reports were secured in order that the figures for each plant might be included in the statistics for the city, county, or state in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products different from those covered by the class designation, and, on the other hand, may not represent the total product covered by this designation, because some of this class of product may be made in establishments in which it is not the product of chief value.

As a rule, the same designation is used for the industry wherever it appears, although all of the products indicated by this designation were not manufactured in the state or city for which these statistics are presented. In some instances the wording is changed so as to more correctly describe the products represented. For a number of industries subclasses are shown which indicate more definitely the kind of products.

Selected industries.—The general tables at the end of this bulletin give the principal facts separately for the industries of the state. A selection has been made of certain leading industries of the state for more detailed consideration. Sometimes an industry of great importance has to be omitted because it comprises so few establishments that a detailed presentation would reveal the operations of individual concerns.

Comparisons with previous censuses.—Owing to changes in industrial conditions it is not always possible to classify establishments by industries in such a way as to permit accurate comparison with preceding censuses. At the census of 1909 the figures for kindred industries were combined. This practice has been followed in compiling the statistics for 1919 and 1914 when placed in comparison with those for 1909 and prior years. The comparative summary for 1919, 1914, and 1909, therefore, does not show separately all the industries given for 1919 in the detailed statement for the state.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1919 with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industry.—The following general classes of persons engaged in the manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners. In the reports for the censuses of 1904 and 1899 these five classes were shown according to the three main groups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. In comparative tables covering the census of 1904 it is of course necessary to group the figures according to the classification that was employed at the earlier censuses.

The number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industries normal conditions of employment, but where this date was not a representative day an earlier date was chosen.

In the case of employees other than wage earners the number thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average has been obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on the representative day, a report was obtained of the number employed on the 15th of each month, by sex, without distinction of age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

The number of wage earners reported for the representative day, though given in certain tables for each separate industry, is not totaled for all industries combined for any state, because, in view of the variations of date, such a total is not believed to be significant. It would involve more or less duplication of persons working in different industries at different times, would not represent the total number employed in all industries at any one time, and would give an undue weight to seasonal industries as compared with industries in continual operation. This total, however, is shown for the different cities, because the limited area and greater regularity of employment largely overcame the objection incident to its publication for the separate states or the United States.

In order to determine as nearly as possible the age distribution of the average number of wage earners for a given state as a whole, the per cent distribution by age of the wage earners in each industry for December 15, or the nearest representative day, has been calculated from the actual numbers reported for that date. The percentages thus obtained have been applied to the average number of wage earners for the year in that industry to determine the average numbers 16 years and over, and under 16, employed. These calculated averages for the several industries have been added to give the average distribution for each state as a whole and for the entire country.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employees or wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates from month to month in every industry, and in some cases to a very great extent. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and while representing the number according to the pay rolls to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variations in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each establishment are therefore counted in the class within which the establishment itself falls. In most establishments, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.—The instructions on the schedule for securing data relating to capital were as follows:

"The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises."

These instructions were identical with those employed at the censuses of 1914 and 1909. The data compiled in respect to capital, however, at both censuses, as well as at all preceding censuses of manufactures, have been so defective as to be of little value except as indicating very general conditions. In fact, it has been repeatedly recommended by the census authorities that this inquiry be omitted from the schedule. While there are some establishments whose accounting systems are such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested.

Materials.—The statistics as to cost of materials relate to the materials used during the year, which may be more or less than the materials purchased during the year. The term "materials" covers fuel, rent of power and heat, mill supplies, and containers, as well as materials which form a constituent part of the product.

Rent and taxes.—The taxes include certain Federal taxes and state, county, and local taxes. Under "Federal taxes" there are included the internal revenue tax on manufactures (tobacco, beverages, etc.), excise taxes when included in values reported for products, corporation capital stock tax, and corporation income tax, but not the income tax for individuals and partners.

Value of products.—The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold.

Value added by manufacture.—The value of products is not always a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part, and often by far the larger one, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry, from a manufacturing standpoint, is the value created by the manufacturing operations carried on within the industry. This value is calculated by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—The census data do not show the entire cost of manufacture, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest, rent of offices and buildings other than factory or works, insurance, ordinary repairs, advertising, and other sundry expenses.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented from other concerns. It does not cover the power of electric motors taking their current from dynamos driven by primary power machines operated by the same establishment, because the inclusion of such power would obviously result in duplication. The figures for primary horsepower represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, fuel oils, gasoline and other volatile oils, and gas—natural and manufactured, and represent the quantity used during the year. As only the principal kinds of fuel are shown, comparison as to the total cost of all fuels is impracticable. A comparison, however, of the total quantities of the several kinds of fuel used in 1919 and 1914 is given.

ALASKA.

GENERAL STATISTICS.

General character of the territory.—Alaska, comprising a gross area of 590,884 square miles, was purchased by the United States from the Russian Government in 1867. The inhabitants of the territory in 1900 numbered 63,592; in 1910, 64,356; and in 1920, 54,899. The number of inhabitants per square mile in 1910 was slightly more than one-tenth of 1, the corresponding figures for 1920 being less than one-tenth of 1. There were no cities in the territory in 1920 having more than 10,000 inhabitants.

Importance and growth of manufactures (Table 1).—The large increases in wages, cost of materials, and the value of products, as presented in this table, are largely due to the change in industrial conditions brought about by the World War, and therefore can not properly be used to measure the growth of manufactures during the census period 1909 to 1919. However, the increases in the average number of wage earners and horsepower are significant evidences of the growth of the manufacturing activities of the territory. The addition of the Federal income tax since 1909 will account for the abnormal increase in "Rent and taxes."

Comparative summary for selected industries (Table 2).—This table emphasizes the importance of the fish-canning industry in Alaska. In 1919 the value of products for fish canning represented 94.4 per cent of

the total for all manufacturing industries in the territory and 92.5 per cent of the average number of wage earners. The corresponding proportions in 1909 were 81 per cent and 87.7 per cent, respectively. Of the total value of products for the fish-canning industry, \$37,354,031, or 95.4 per cent, was canned salmon.

Wage earners, by months (Table 3).—The statistics for wage earners generally will show the steadiness of employment, or the reverse, in accordance with the industrial conditions existing during the several census years. The preponderance of the fish-canning industry is emphasized in this table, which shows such large proportions of the wage earners employed during the summer months, when the canneries were in operation.

Character of ownership (Table 4).—The prominence of corporate ownership in manufactures is illustrated in this table, which shows the large percentages of the several items reported by this form of ownership.

Size of establishments, by value of products (Table 5).—At the census of 1909 establishments with products valued at \$100,000 to \$1,000,000 constituted one group, but at the census of 1919 this group was subdivided into "\$100,000 to \$500,000" and "\$500,000 to \$1,000,000." The table, therefore, gives combined figures for these two additional groups in the case of all items for 1909.

EXPLANATION OF TERMS.

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, and similar subjects. When use is made of the statistics for these purposes it is imperative that due attention be given to their limitations, particularly in connection with any attempt to derive from them figures purporting to show average wages, cost of production, or profits.

The census of Hawaii for 1919, like that for 1909, was not confined strictly to manufacturing establishments conducted under the factory system, as distinguished from the neighborhood, hand, and building industries.

The census did not cover establishments which were idle during the entire year or whose products were valued at less than \$500, or the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule, the term "establishment" represents a single plant or factory, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept. If, however, the plants constituting an establishment as thus defined were not all located within the same city or county, separate reports were secured in order that the figures for each plant might be included in the statistics for the city or county in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products different from those covered by the class designation, and, on the other hand, may not represent the total product covered by this designation, because some of this class of product may be made in establishments in which it is not the product of chief value.

Selected industries.—The general tables at the end of this bulletin give the principal facts separately for the industries of the territory. A selection has been made of certain leading industries of the territory for more detailed consideration. Sometimes an industry of great importance has to be omitted because it comprises so few establishments that these detailed presentations would reveal the operations of individual concerns.

Comparisons with previous censuses.—Owing to changes in industrial conditions it is not always possible to classify establishments by industries in such a way as to permit accurate comparison with preceding censuses. At the census of 1909 the figures for kindred industries were combined. This practice has been followed in compiling the statistics for 1919 when placed in comparison with those for 1909 and prior years. The comparative summary for 1919, 1909, and 1899, therefore, does not show separately all the industries given for 1919 in the detailed statement for the territory.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1919 with the corresponding figures for earlier censuses, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industry.—The following general classes of persons engaged in the manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners. In the report for the census of 1899 these five classes were shown according to the three main groups: (1) Proprietors and firm members, (2) salaried officials, clerks, etc., and (3) wage earners. In comparative tables covering the census of 1899 it is of course necessary to group the figures according to the classification that was employed at the earlier censuses.

The number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industries normal conditions of employment, but where this date was not a representative day an earlier date was chosen.

In the case of employees other than wage earners the number thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average has been obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on the representative date, a report was obtained of the number employed on the 15th of each month, by sex, without distinction of age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

The number of wage earners reported for the representative day, though given in certain tables for each separate industry, is not totaled for all industries combined, because, in view of the variations of date, such a total is believed not to be significant. It would involve more or less duplication of persons working in different industries at different times, would not represent the total weight employed in all industries at any one time, and would give an undue weight to seasonal industries as compared with industries in continual operation.

In order to determine as nearly as possible the age distribution of the average number of wage earners for the territory as a whole, the per cent distribution by

age of the wage earners in each industry for December 15, or the nearest representative day, has been calculated from the actual numbers reported for that date. The percentages thus obtained have been applied to the average number of wage earners for the year in that industry to determine the average numbers 16 years and over, and under 16, employed.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employees or wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates from month to month in every industry, and in some cases to a very great extent. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and while representing the number according to the pay rolls to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variations in hours in an establishment from one part of the year to another were disregarded, and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each establishment are therefore counted in the class within which the establishment itself falls. In most establishments, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.—The instructions on the schedule for securing data relating to capital were as follows:

"The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises."

These instructions were identical with those employed at the census of 1909. The data compiled in respect to capital, however, at that census, as well as at the preceding census of manufactures, have been so defective as to be of little value except as indicating very general conditions. In fact, it has been repeatedly recommended by the census authorities that this inquiry be omitted from the schedule. While there are some establishments whose accounting systems are such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested.

Materials.—The statistics as to cost of materials relate to the materials used during the year, which may be more or less than the materials purchased during the year. The term "materials" covers fuel, rent of power and heat, mill supplies, and containers, as well as materials which form a constituent part of the product.

Rent and taxes.—The taxes include certain Federal taxes and state, county, and local taxes. Under "Federal taxes" there are included the internal revenue tax on manufactures (tobacco, beverages, etc.), excise taxes when included in values reported for products, corporation capital stock tax, and corporation income tax, but not the income tax for individual and partnership establishments.

Value of products.—The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold.

Value added by manufacture.—The value of products is not always a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part, and often by far the larger one, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry, from a manufacturing standpoint, is the value created by the manufacturing operations carried on within the industry. This value is calculated by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—The census data do not show the entire cost of manufacture, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest, rent of offices and buildings other than factory or works, insurance, ordinary repairs, advertising, and other sundry expenses.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented from other concerns. It does not cover the power of electric motors taking their current from dynamos driven by primary power machines operated by the same establishment, because the inclusion of such power would obviously result in duplication. The figures for primary horsepower represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, fuel oils, gasoline and other volatile oils, and gas—natural and manufactured, and represent the quantity used during the year. As only the principal kinds of fuel are shown, comparison as to the total cost of all fuel is impracticable. A comparison, however, of the total quantities of the several kinds of fuel used in 1919 and 1909 is given.

HAWAII.

GENERAL STATISTICS.

General character of the territory.—Hawaii consists of a group of 20 islands which lie in the North Pacific Ocean, more than 2,000 miles from the nearest mainland. The main islands of the group extend over a distance of 390 miles from the westernmost point of Niihau to the eastern extremity of the island of Hawaii. It lies within longitude $154^{\circ} 40'$ and $160^{\circ} 30'$ west, and latitude $22^{\circ} 16'$ and $18^{\circ} 55'$ north.

Of the 20 islands comprising the group, only 9 are inhabited, 2 having a very small population. The land area of the territory contains 6,449 square miles. Its population in 1900 was 154,001; in 1910, 191,909; and in 1920, 255,912.

Honolulu (coextensive with Honolulu district), with 83,327 inhabitants, and Hilo, with 10,431 inhabitants, are the only two cities in 1920 having a population of 10,000 or more. The remainder of the population is mostly rural.

Hawaii has no important mineral resources, but its climate and soil are well adapted to agriculture, and its industrial progress is dependent entirely upon its agricultural products.

Comparative summary (Table 1).—This table summarizes the more important data relative to all classes of manufactures combined in the territory of Hawaii for the censuses of 1899, 1909, and 1919.

In connection with the percentages of increase from census to census, due consideration must be given to the fact that increases in wages, in cost of materials used, and in value of products since 1909 reflect very largely industrial conditions brought about by the World War and the lessened purchasing power of the dollar.

Principal industries, ranked by value of products (Table 2).—As shown in this table the prosperity of Hawaii depends largely on the production of sugar. Rice ranked second in value of products in 1909. Its loss in position is due to the phenomenal growth in the value of pineapples canned, which increased 1,094 per cent during the decade, while the increase in rice was 142.8 per cent.

Persons engaged in manufacturing industries (Table 3).—The age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the "Explanation of terms." The classification by sex for 1919 was reported separately, but for 1909 was obtained in the same manner as the distribution by age. Figures for individual industries will be found in Table 20.

Average number of wage earners for selected industries and cities (Table 4).—The industries included in this table embrace those having 100 or more wage earners in 1919, and for which statistics can be shown without the possibility of disclosing individual operations.

Wage earners employed, by months (Table 5).—The statistics for wage earners are intended to show the steadiness of employment, or the reverse, in accordance with the conditions as they existed at the two censuses. The wide variation in the numbers employed in July and August over the other months is due to the canning and preserving of pineapples, which industry is seasonal in character.

Wage earners, by months, for selected industries and cities (Table 6).—In addition to the number employed by months, this table gives similar data for males and females for all industries combined. There was no industry in 1919 in which female wage earners predominated; but the industries which provided employment for a large number of that sex are shown.

Prevailing hours of labor (Table 7).—Since the census of 1909 there has been a shortening of the hours of labor for wage earners. In 1909, 44.1 per cent were included in the group "over 60"; the corresponding proportion in 1919 was 29.6 per cent.

Size of establishments, by average number of wage earners, for selected industries and cities (Table 8).—The extent to which the small manufacturing establishment predominated in the territory is shown in this table. Only 5 establishments employed more than 250 wage earners each.

Size of establishments, by value of products (Table 9).—At the census of 1909 establishments with products of \$100,000 to \$1,000,000 formed one group; but in 1919 this group was subdivided as follows: "\$100,000 to \$500,000" and "\$500,000 to \$1,000,000." The figures for these two groups separately were not available for 1909.

Size of establishments, by value of products, for selected industries (Table 10).—In the preparation of this table it was necessary in several instances to combine the establishments of one group with those of some other group to avoid the possibility of disclosing the operations of individual establishments.

Size of establishments, by value of products, for cities of 10,000 inhabitants or more (Table 11).—The statistics for the cities of Hilo and Honolulu are shown in this table.

Character of ownership (Table 12).—It will be seen from this table that, notwithstanding the increase of 29.3 per cent in the number of establishments owned by corporations in 1919 over 1909, there was a decrease in the total number, due to a loss of 34.2 per cent of the number owned by "all others."

Manufactures, by population groups, in cities of 10,000 inhabitants or more (Table 13).—The extent to which manufacturing is centralized in the cities of Hilo and Honolulu is shown in this table. In 1919 Honolulu produced 32.8 per cent of the total value of products, and employed 54.7 per cent of the average number of wage earners; the corresponding percentages in 1899 were 14 per cent and 25.4 per cent, respectively.

Power and horsepower of types of prime movers (Table 14).—Steam engines decreased 22.7 per cent in number in 1919, but increased 30.1 per cent in horsepower; steam furnished 78.4 per cent of the total horsepower in 1919. Rented (or purchased) electric power increased 630.3 per cent in number of motors and 989.4 per cent in horsepower during the ten-year period.

Fuel consumed (Table 15).—As the Hawaiian Islands have practically no mineral resources, all mineral fuel must be procured elsewhere, principally from the United States. In the sugar-mill industry a large amount of fuel is required and has been largely supplied by the refuse from sugar cane.

TABLE 1.—COMPARATIVE SUMMARY: 1919, 1909, AND 1899.

	MANUFACTURING INDUSTRIES.			PER CENT OF INCREASE. ¹

1 Among the industries, the statistics for which can not be shown separately without the possibility of disclosing individual operations, are a number having products in excess of some for which figures are shown in the table. Of these industries the most important are the following: Fertilizers; foundry and machine-shop products; gas, illuminating and heating; slaughtering and meat packing; and tinware, not elsewhere specified.

NOTE.—The articles included under "Food preparations, not elsewhere specified," for 1919 and 1909 are shown in the following statement:

SPECIAL STATISTICS.

For certain industries the Census Bureau collects, by means of special schedules, details regarding the quantity and value of materials and products which do not appear on the general schedule. Data for the quantity and value of products for two important industries in Hawaii are here presented.

Canning and preserving, pineapples.—The value of the canning and preserving pineapple industry amounted to \$18,997,975 in 1919; this includes by-products, consisting of string beans, pineapple jellies, and lime juice, valued at \$114,761; in 1909 the total value of products was \$1,591,073. Owing to the variations in the sizes of cans used at the two censuses, comparative data of quantities of products can not be shown.

The following statement gives the number of cases put up during 1919 according to the various size cans:

WEIGHT.	Number of cases.	WEIGHT.	Number of cases.
12-ounce No. 1 cans.....	403,632	110-ounce No. 10 cans.....	1,023,625
20-ounce No. 2 cans.....	1,759,700	Special sizes and weights...	9,002
30-ounce No. 2½ cans.....	1,777,227		

Rice mills (Table 16).—The following table shows the growth of custom milling during the last census period. In 1919 the value of custom treated rice formed 52.9 per cent of the total value of rice milled, while the corresponding percentage for 1909 was only 39.5 per cent.

TABLE 16.—RICE MILLS: 1919 AND 1909.

	1919	1909

Merchant milled.....	2,561,188	1,354,267
Custom milled.....	2,875,267	884,400

Rice, cleaning and polishing (Table 17).—The quantities of domestic and foreign rough rice milled in 1919 and 1909 are shown in this table. The aggregate value of rice products increased 142.8 per cent in 1919 over 1909.

TABLE 17.—RICE, CLEANING AND POLISHING: 1919 AND 1909.

GENERAL TABLES.

Table 19 gives the number of establishments, average number of wage earners, primary horsepower, wages, cost of materials, and value of products for all industries combined, and for selected industries (1) for the territory as a whole and (2) for the city of Honolulu, 1919, 1909, and 1899.

Table 20 presents, for 1919, statistics in detail for the territory as a whole and for each industry that

can be shown without the disclosure of individual operations.

Table 21 presents, for 1919, statistics in detail for the city of Honolulu as a whole and for each industry that can be shown without the disclosure of individual operations; statistics are also shown for the city of Hilo for all industries combined.

MINES AND QUARRIES.

Comparative summary.—The statistics of quarries shown in the accompanying table for the year 1919 (with comparative figures for 1909) are compiled from returns received from establishments engaged in quarrying basalt or trap rock, which was used principally as rubble and for road work and, to a

limited extent, also for curbing, building, and concrete construction.

Limestone was also quarried on the islands for use in lime manufacture; the returns received on such operations are included in the statistics compiled for manufactures.

TABLE 22.—QUARRIES, COMPARATIVE SUMMARY: 1919 AND 1909.

EXPLANATION OF TERMS.

Scope of census.—Census statistics of manufactures are compiled primarily for the purpose of showing the absolute and relative magnitude of the different branches of industry covered and their growth or decline. Incidentally, the effort is made to present data throwing light upon character of ownership, size of establishments, and similar subjects. When use is made of the statistics for these purposes it is imperative that due attention be given to their limitations, particularly in connection with any attempt to derive from them figures purporting to show average wages, cost of production, or profits.

The census did not cover establishments which were idle during the entire year or for which products were valued at less than \$500, or the manufacturing done in educational, eleemosynary, and penal institutions.

Period covered.—The returns relate to the calendar year 1919, or the business year which corresponded most nearly to that calendar year, and cover a year's operations, except for establishments which began or discontinued business during the year.

The establishment.—As a rule, the term "establishment" represents a single plant or factory, but in some cases it represents two or more plants which were operated under a common ownership or for which one set of books of account was kept. If, however, the plants constituting an establishment as thus defined were not all located within the same municipality, separate reports were secured in order that the figures for each plant might be included in the statistics for the municipality in which it was located. In some instances separate reports were secured for different industries carried on in the same establishment.

Classification by industries.—The establishments were assigned to the several classes of industries according to their products of chief value. The products reported for a given industry may thus, on the one hand, include minor products different from those covered by the class designation, and, on the other hand, may not represent the total product covered by this designation, because some of this class of product may be made in establishments in which it is not the product of chief value.

As a rule, the same designation is used for the industry wherever it appears, although all of the products indicated by this designation were not manufactured in the municipality for which these statistics are presented. In some instances the wording is changed so as to more correctly describe the products represented. For a number of industries subclasses are shown which indicate more definitely the kind of products.

Selected industries.—The general tables at the end of this bulletin give the principal facts separately for the industries of the territory. A selection has been made of certain leading industries of the territory for more detailed consideration. Sometimes an industry of great importance has to be omitted because it comprises so few establishments that these detailed presentations would reveal the operations of individual concerns.

Comparisons with previous census.—Owing to changes in industrial condition it is not always possible to classify establishments by industries in such a way as to permit accurate comparison with preceding census. At the census of 1909 the figures for kindred industries were combined. This practice has been followed in compiling the statistics for 1919 when placed in comparison with those for 1909. The comparative summary for 1919 and 1909, therefore, does not show separately all the industries given for 1919 in the detailed statement for the territory.

Influence of increased prices.—In comparing figures for cost of materials, value of products, and value added by manufacture in 1919 with corresponding figures for 1909, account should be taken of the general increase in the prices of commodities during recent years. To the extent to which this factor has been influential the figures fail to afford an exact measure of the increase in the volume of business.

Persons engaged in the industry.—The following general classes of persons engaged in the manufacturing industries were distinguished: (1) Proprietors and firm members, (2) salaried officers of corporations, (3) superintendents and managers, (4) clerks (including other subordinate salaried employees), and (5) wage earners.

The number of persons engaged in each industry, segregated by sex, and, in the case of wage earners, also by age (whether under 16 or 16 and over), was reported for a single representative day. The 15th of December was selected as representing for most industries normal conditions of employment, but where this date was not a representative day an earlier date was chosen.

In the case of employees other than wage earners the number thus reported for the representative date has been treated as equivalent to the average for the year, since the number of employees of this class does not ordinarily vary much from month to month. In the case of wage earners the average has been obtained in the manner explained in the next paragraph.

In addition to the more detailed report by sex and age of the number of wage earners on the representative date, a report was obtained of the number employed on the 15th of each month, by sex, without distinction of age. From these figures the average number of wage earners for the year has been calculated by dividing the sum of the numbers reported for the several months by 12. The importance of the industry as an employer of labor is believed to be more accurately measured by this average than by the number employed at any one time or on a given day.

In order to determine as nearly as possible the age distribution of the average number of wage earners for the territory as a whole, the per cent distribution by age of the wage earners in each industry for December 15, or the nearest representative day, has been calculated from the actual numbers reported for that date. The percentages thus obtained have been applied to the average number of wage earners for the year in that industry to determine the average numbers 16 years and over, and under 16, employed. These calculated averages for the several

industries have been added to give the average distribution for the territory as a whole.

Salaries and wages.—Under these heads are given the total payments during the year for salaries and wages, respectively. The Census Bureau has not undertaken to calculate the average annual earnings of either salaried employees or wage earners. Such averages would possess little real value, because they would be based on the earnings of employees of both sexes, of all ages, and of widely varying degrees of skill. Furthermore, so far as wage earners are concerned, it would be impossible to calculate accurately even so simple an average as this, since the number of wage earners fluctuates from month to month in every industry, and in some cases to a very great extent. The Census Bureau's figures for wage earners, as already explained, are averages based on the number employed on the 15th of each month, and, while representing the number, according to the pay rolls, to whom wages were paid on that date, no doubt represent a larger number than would be required to perform the work in any industry if all were continuously employed during the year.

Prevailing hours of labor.—No attempt was made to ascertain the number of wage earners working a given number of hours per week. The inquiry called merely for the prevailing practice followed in each establishment. Occasional variations in hours in an establishment from one part of the year to another were disregarded and no attention was paid to the fact that a few wage earners might have hours differing from those of the majority. All the wage earners of each establishment are therefore counted in the class within which the establishment itself falls. In most establishments, however, practically all the wage earners work the same number of hours, so that the figures give a substantially correct representation of the hours of labor.

Capital.—The instructions on the schedule for securing data relating to capital were as follows:

"The answer should show the total amount of capital, both owned and borrowed, on the last day of the business year reported. All the items of fixed and live capital may be taken at the amounts carried on the books. If land or buildings are rented, that fact should be stated and no value given. If a part of the land or buildings is owned, the remainder being rented, that fact should be so stated and only the value of the owned property given. Do not include securities and loans representing investments in other enterprises."

These instructions were identical with those employed at the census of 1909. The data compiled in respect to capital, however, have been so defective as to be of little value except as indicating very general conditions. In fact, it has been repeatedly recommended by the census authorities that this inquiry be omitted from the schedule. While there are some establishments whose accounting systems are such that an accurate return for capital could be made, this is not true of the great majority, and the figures therefore do not show the actual amount of capital invested.

Materials.—The statistics as to cost of materials relate to the materials used during the year, which may be more or less than the materials purchased during the year. The term "materials" covers fuel, rent of power and heat, mill supplies, and containers, as well as materials which form a constituent part of the product.

Rent and taxes.—The taxes include certain Federal taxes and insular and local taxes. Under "Federal taxes" there are included the internal revenue tax on manufactures (tobacco, beverages, etc.), excise taxes when included in values reported for products, corporation capital stock tax, and corporation income tax, but not the income tax for individual and partnership establishments.

Value of products.—The amounts given under this heading represent the selling value or price at the factory of all products manufactured during the year, which may differ from the value of the products sold.

Value added by manufacture.—The value of products is not always a satisfactory measure of either the absolute or the relative importance of a given industry, because only a part of this value is actually created by the manufacturing processes carried on in the industry itself. Another part, and often by far the larger one, represents the value of the materials used. For many purposes, therefore, the best measure of the importance of an industry, from a manufacturing standpoint, is the value created by the manufacturing operations carried on within the industry. This value is calculated by deducting the cost of the materials used from the value of the products. The figure thus obtained is termed in the census reports "value added by manufacture."

Cost of manufacture and profits.—The census data do not show the entire cost of manufacture, and consequently can not be used for the calculation of profits. No account has been taken of depreciation or interest, rent of offices and buildings other than factory or works, insurance, ordinary repairs, advertising, and other sundry expenses.

Primary horsepower.—This item represents the total primary power generated by the manufacturing establishments plus the amount of power, principally electric, rented from other concerns. It does not cover the power of electric motors taking their current from dynamos driven by primary power machines operated by the same establishment, because the inclusion of such power would obviously result in duplication. The figures for primary horsepower represent the rated capacity of the engines, motors, etc., and not the amount of power in actual daily use.

Fuel.—Statistics of the quantity of fuel used are shown only for anthracite and bituminous coal, coke, fuel oils, gasoline and other volatile oils, and gas, and represent the quantity used during the year. As only the principal kinds of fuel are shown, comparison as to the total cost of all fuel is impracticable.

PORTO RICO.

GENERAL STATISTICS.

General character of the territory.—Porto Rico contains 3,435 square miles. Its population in 1899 was 953,243; in 1910, 1,118,012; and in 1920, 1,299,809.

Comparative summary (Table 1).—This table summarizes the more important data relative to all classes of manufactures combined in the territory of Porto Rico for the censuses of 1919 and 1909.

In connection with the percentages of increase, due consideration must be given to the fact that increases in wages, in cost of materials used, and in value of products since 1909 reflect very largely industrial conditions brought about by the World War and the lessened purchasing power of the dollar.

Principal industries ranked by value of products (Table 2).—The ranking of industries by value of products is often misleading as to their true importance from a manufacturing standpoint. The coffee cleaning and polishing industry, for instance, which ranked second in value of products, ranked fourth by average number of wage earners and value added by manufacture.

Persons engaged in manufacturing industries (Table 3).—The age classification of the average number of wage earners in this and other tables is an estimate obtained by the method described in the "Explanation of terms." The classification by sex in 1919 was reported separately, but in 1909 was obtained in the same manner as the distribution by age. Figures for individual industries will be found in Table 19.

Average number of wage earners for selected industries (Table 4).—The industries included in this table embrace those having 100 or more wage earners in 1919, and for which statistics can be shown without the possibility of disclosing individual operations.

Average number of wage earners, by sex and age, and value of products, for cities of 10,000 inhabitants or more (Table 5).—The two leading manufacturing cities, San Juan and Ponce, show considerable increases in the number of females employed in 1919 over 1909, while the class "under 16 years of age" has been reduced from 135 to 3 in San Juan and from 88 to 3 in Ponce during the decade. The table shows large gains in the value of products for each city for which comparative data can be shown.

Wage earners employed, by months (Table 6).—The statistics for wage earners are intended to show the steadiness of employment, or the reverse, in accordance with the conditions as they existed for the two censuses. For the territory the variations between

the maximum and minimum are most noticeable in the months of June and July.

Wage earners, by months, for selected industries and cities (Table 7).—In addition to the number employed by months, similar data are given for males and females for all industries combined and for the females for four industries which provided employment for a large number of that sex.

Prevailing hours of labor (Table 8).—In comparing the data for the two years reported a marked change is noted in the hours of labor per week for wage earners; about three-fourths, or 74.8 per cent, of the wage earners for 1919 worked more than 48 hours per week, as compared with 55 per cent of the number of wage earners who worked the same number of hours in 1909.

Size of establishments, by average number of wage earners, for selected industries and cities (Table 9).—The extent to which the small manufacturing establishments predominated in the territory is shown in this table. Only 12 establishments employed more than 250 wage earners.

Size of establishments, by value of products (Table 10).—In 1909 establishments with products valued at \$100,000 to \$1,000,000 formed one group, but in 1919 this group was subdivided, as follows: \$100,000 to \$500,000 and \$500,000 to \$1,000,000. The figures for these two groups separately are not available for 1909.

Size of establishments, by value of products, for selected industries (Table 11).—In the preparation of this table it was necessary in several instances to combine the establishments of one group with those of some other group to avoid the possibility of disclosing the operations of individual establishments.

Size of establishments, by value of products, for cities of 10,000 inhabitants or more (Table 12).—This table shows that few of the establishments in the group, "1,000,000 and over," are located within the corporate limits of the cities.

Character of ownership, for selected industries and cities (Table 13).—The tendency of manufactures toward the corporate form of ownership is evidenced by the increase in the number of establishments under "corporations" in 1919 over 1909, while "individuals" and "all others" show large decreases during the decade.

Manufactures, by population groups (Table 14).—This table furnishes data for cities of 10,000 inhabitants or more arranged in two groups—"10,000 to 25,000" and "25,000 to 100,000."

MANUFACTURES—PORTO RICO.

Number and horsepower of types of prime movers (Table 15).—The use of steam and internal-combustion engines shows a marked increase in both the number of engines and in horsepower for 1919 as compared with 1909, the most noticeable being that of the number of internal-combustion engines, which increased 200 per cent.

Rented electric power increased 371.8 per cent in

number of motors and 381 per cent in horsepower during the ten-year period.

Fuel consumed, for selected industries and cities (Table 16).—The total quantities of the principal kinds of fuel used by the manufacturing plants in the territory, 1919 and 1909, are shown in this table, and also, for 1919, the amounts used by a number of industries which are large consumers of fuel.

SPECIAL STATISTICS.

For a number of important industries the Census Bureau collects, by means of special schedules, certain details which do not appear in the general schedule.

Sugar and molasses.—In 1919 there were reported 686,037,703 pounds of raw sugar, 122,668,473 pounds of clarified sugar, 10,342,600 pounds of brown sugar, and 18,783,172 gallons of molasses, as compared with 566,445,203 pounds of raw sugar and 17,874,097 gallons of molasses in 1909. The total value of all kinds of sugar was \$55,607,202, of molasses \$637,799, and of all other products \$166,931, or an aggregate value of products of \$56,411,932 in 1919, as compared with \$20,164,887 for raw sugar, \$397,008 for molasses, and \$7,453 for all other products in 1909. As already stated, sugar is the leading manufacturing industry of the island. The modern methods and machinery installed in recent years have increased the production of sugar, but the quantity of molasses produced has remained about stationary. In 1909 there were no refineries in Porto Rico, and all the sugar used and exported was raw brown sugar.

Tobacco manufactures.—The quantity of cigarettes and the value of cigars and cigarettes can not be published separately without disclosing the operations of individual establishments, but a total of 171,184,749 cigars was reported as manufactured during 1919, as compared with 217,792,000 manufactured during

1909. The total value of all tobacco products for 1919 was \$8,134,534, as compared with \$6,060,393 for 1909. While the tobacco plant is indigenous to the island, its cultivation was, prior to 1870, confined to small plantings for domestic consumption.

Coffee, cleaning and polishing.—The coffee tree is not native to the island, but was introduced there in the first half of the eighteenth century. Practically all of the coffee raised goes through a complete or partial process of cleaning, hulling, polishing, and grading to prepare it for the market. The total quantity of cleaned and polished coffee reported in 1919 was 50,252,820 pounds, as compared with 44,350,435 pounds in 1909. All but 3 of the 31 coffee mills reported the process of polishing the coffee. The modern wet process is superseding the older dry method, but requires a larger investment than the small planters can afford. The result is that the business of preparing the coffee for market is being transferred from the plantation to the large custom mills. The total value of products for 1919 was \$11,443,636, as compared with \$5,052,599 for 1919.

The following statement shows the number of coffee cleaning and polishing establishments engaged in merchant and in custom work, together with the value of products of the several classes of establishments in 1919 and 1909:

	1919	1909
Total number of mills.....	31	37
Merchant.....	18	26
Custom.....	13	7
Merchant and custom.....		4
Total value of products.....	\$11,443,636	\$5,052,599
Merchant milled.....	7,775,631	2,899,491
Custom milled.....	3,668,005	2,153,108

Laundries.—Statistics for power laundries are not included in the general tables nor in the totals for manufacturing industries. Table 17, however, summarizes the statistics for such laundries in the territory for 1919.

GENERAL TABLES.

Table 18 gives the number of establishments, average number of wage earners, primary horsepower, wages, cost of materials, and value of products for all industries combined and for selected industries in the territory, 1919 and 1909. Certain kindred

industries are combined in some instances for comparison with 1909. Table 19 presents, for 1919, statistics in detail for the territory as a whole and for each industry that can be shown without the disclosure of individual operations.

TABLE 18.—COMPARATIVE SUMMARY FOR SELECTED INDUSTRIES AND CITIES: 1919 AND 1909.

MINES AND QUARRIES.

The gross value of products of all quarries (there being no mines reported as such) in Porto Rico in 1919 amounted to \$158,157. It is of interest to note that while the number of quarries decreased 7.1 per cent during the decennial period, capital increased 143.2 per cent and value of products 2,797.2 per cent.
