CHAPTER II.—SEX DISTRIBUTION.

INTRODUCTION.

The distribution by sex of the white population of the United States has been ascertained at every Federal census, but data on this subject for the total population were collected for the first time in 1820.

The distribution of population by sex is a fundamental classification essential to a proper interpretation of almost every other phase of population statistics. The sex distinction is accordingly presented in other chapters of this volume in correlation with other population statistics, and this chapter is devoted mainly to a consideration of the relative numerical importance of the two sexes in different sections of the country and in the principal color or race, nativity, and parentage classes of the population.

The returns as to sex are probably more nearly accurate than those for any other population census inquiry. There is no ambiguity of terms, and rarely any motive to misrepresent the facts; and very few errors are likely to be made regarding the sex of persons enumerated. It is possible, of course, that the sex distribution shown by the returns may be affected slightly by omissions or duplications which may be relatively more numerous for one sex than for the other, but it is not believed that such errors are of sufficient frequency to influence appreciably the sex ratio for the total population of all races or for the total white population.

For the several classes of the white population, however, there is likely to be a margin of error due to incorrect returns as to nativity and parentage. It is not improbable that some persons of foreign birth are erroneously reported as of native birth, or even as of native parentage, and that some persons of native birth but of foreign or mixed parentage are erroneously included with those of native parentage. Such errors are more likely to occur in the case of males than in the case of females, for the reason that the former predominate among the foreign born and among the floating population, for both of which classes accurate information is difficult to obtain.

Total population.—The statistics on sex distribution for the population of the United States, exclusive of outlying possessions, as returned at the Fourteenth Decennial Census, are summarized in Table 1, and comparative figures are presented for prior censuses. Statistics of sex distribution for the population of all

the outlying possessions except the Philippines and the Virgin Islands¹ are given in the reports for those possessions, which have been published in the form of separate bulletins and as sections of Volume III of the Fourteenth Census Reports.

The following statement shows the excess of males in the total population for each census year beginning with 1820, sex distribution having been ascertained for the white population only at the censuses of 1810, 1800, and 1790.

CENSUS YEAR.	Excess of males.	CENSUS YEAR.	Excess of males.	CENSUS YEAR.	Excess of males.
1820.....	2,000,242	1880.....	881,857	1840.....	307,611
1910.....	2,692,288	1870.....	428,750	1830.....	195,058
1900.....	1,635,321	1890.....	727,087	1820.....	154,757
1890.....	1,526,488	1850.....	483,444		

¹ Distribution by sex partly estimated for Indian Territory.

This preponderance of males is due in part to the fact that the total population includes a considerable proportion of foreign-born persons, among whom the males greatly outnumber the females; but in the most important class of the native population, namely, the native whites of native parentage, there is also a marked excess of males.

White population.—The preponderance of males over females in the white population is due in part to the abnormal sex distribution of the foreign-born white, but among the native whites also the males outnumbered the females in 1920 by 696,505. This excess, however, occurs only among the native whites of native parentage, the foreign-parentage and mixed-parentage groups both showing an excess of females in 1920. (See Table 1.)

This preponderance of males among the native whites of native parentage has appeared at each census beginning with that for 1890, at which the sex distinction between native and foreign parentage was first made. For all native whites combined an excess of males has also been shown at each census beginning with 1850, when the classification according to nativity was first made.

The reduction in the sex ratio for the total native white population between 1910 and 1920 was more

¹ These two possessions were not enumerated in 1920, a census of the Philippines having been taken by the Philippine Government as of December 31, 1918, and a special census of the Virgin Islands having been taken by the Census Bureau as of November 1, 1917.

pronounced than any prior change, either increase or decrease, since 1880. This reduction is the result of various causes, including emigration, war losses, and increase in military and naval services stationed abroad at the time the census was taken and therefore not included in the population of continental United States.

The sex ratios for the native whites of native parentage, of foreign parentage, and of mixed parentage all declined to approximately the same extent; but the declines in the case of the native whites of foreign parentage and of mixed parentage were in line with those which had taken place during previous decades, whereas in the case of native whites of native parentage the decline between 1910 and 1920 followed increases during preceding decades.

The ratio for the foreign-born whites declined much more sharply than that for the native whites, but nevertheless was higher in 1920 than in any census year between 1850 and 1910. The decline was presumably due mainly to a large excess of males among the foreign-born whites who emigrated from the United States during the decade.

Negro population.—Differing from all other races, the Negroes have shown an excess of females over males at every census since and including that of 1840, although the returns for 1820 and 1830 showed a preponderance of males. The excess of females was most pronounced, according to the figures, in 1870, but it is generally recognized that the census taken in that year was very defective in the Southern states, and it is likely that among the Negroes the underenumeration was somewhat greater in the case of males than in the case of females.

The abnormal sex ratio appearing for the mulattoes is undoubtedly due to the inaccuracy of the returns for this subclass. In both 1910 and 1920 the black population showed an excess of males, while among the mulattoes the females, as reported, considerably outnumbered the males, the excess for 1920 being greater than that for any of the three earlier census years—1910, 1870, and 1860—for which data are available. (At the censuses of 1900 and 1880 the Negro population was not classified as black and mulatto; in 1890 the definition applied to the term "mulatto" was different from that applied in 1920 and 1910; in 1870 the word was used in substantially the same sense as at the last two censuses; and in 1860 it appears not to have been defined.)

It is possible that the explanation of the peculiar sex ratio shown for the mulattoes is to be found in the incorrect return of certain mulattoes as blacks, the error having been greater in the case of males than in that of females. Since the blacks are far more numerous than the mulattoes, the enumerators were likely to return as blacks those Negroes whom they did not see in person, and since the Negro women at home were more apt to be seen by the enumerators than

were the men, the erroneous return of mulattoes as blacks probably occurred more frequently in regard to men than in regard to women.

Indian population.—At every census except that of 1870 the Indian population has shown an excess of males. No attempt was made, however, to secure a complete enumeration of this race prior to 1890, and it is doubtful whether the figures for earlier census years are of any material value as showing the true sex ratio of the total Indian population. The more recent returns also are subject to a somewhat greater margin of error than are those for the other races, due to the effort to treat as Indian all persons having any trace of Indian blood. It is likely that some persons in whom the admixture of Indian blood was so slight as not to be readily noticeable were erroneously reported as white, and there may have been differences between the two sexes in regard to the frequency of such errors.

Chinese, Japanese, and "all other" population.—Among the Chinese, Japanese, and other minor elements of the population the excess of males is very great, although there has been a pronounced decrease in the sex ratio from census to census since 1890 in the case of the Chinese and since 1900 in the case of the Japanese. The great majority of persons of the Chinese, Japanese, and "all other" races in the United States are immigrants, and among these immigrants the males are greatly in excess of the females.

Urban and rural population.—Since marked differences exist between urban and rural communities in regard to the sex distribution of their population, separate statistics are given for the two classes of communities in Table 9, for geographic divisions. Statistics for the several color or race, nativity, and parentage classes of the urban and rural population are not here presented for individual states, but the sex distribution of these classes in the urban and rural communities of each state (without classification of the urban communities according to size) is shown in Table 1 of the state bulletin and of the appropriate section of Volume III. In drawing the distinction between urban and rural population, all incorporated places (and all towns in Massachusetts, Rhode Island, and New Hampshire) having 2,500 inhabitants or more are treated as urban and the rest of the country as rural.

In Massachusetts and Rhode Island it is not the practice, as in practically all the other states, to incorporate, as separate municipalities, the relatively densely populated portions of "towns" (which are the primary divisions of the counties), and no town as a whole is incorporated as a municipality until it attains a population greatly in excess of 2,500; and in New Hampshire a similar condition exists, although there are in the state two incorporated villages, each of which has fewer than 2,500 inhabitants. For this reason those towns having 2,500 or more inhabitants

in the three states named are treated as urban, although portions of their areas are rural in character. The urban areas in the three states in question, as classified by the census, thus contain relatively small numbers of inhabitants who in other sections of the country would be segregated as rural. Nevertheless, in most of the Massachusetts, New Hampshire, and Rhode Island towns having 2,500 inhabitants or more by far the greater part of the population resides within the more densely settled areas, so that the proportion classed as urban is not greatly exaggerated by the practice adopted.

The ratio of males to females is decidedly higher in rural than in urban communities, not only for the total population but for each of its elements except the numerically unimportant group "Indian, Chinese, Japanese, and all other." (See Table 9.) In the case of this group the explanation of the higher ratio

in urban than in rural communities is found in the fact that the Chinese, whose sex distribution is abnormal, the males being very greatly in excess of the females, are found mainly in urban communities, whereas the Indians, whose sex distribution is normal, live principally in rural communities. The Japanese, among whom the excess of males is abnormal, although not to so great an extent as among the Chinese, are nearly equally divided between urban and rural.

This difference between urban and rural communities in regard to the sex distribution of the principal classes of the population—which exists despite the fact that the foreign born, among whom the males considerably outnumber the females, are more numerous in urban than in rural communities—is doubtless due primarily to the fact that the cities afford many more opportunities for the gainful employment of women than do the rural districts.

POPULATION.

RATIO OF MALES TO FEMALES IN TOTAL POPULATION, BY STATES: 1920.

¹ Ratio not shown where number of females is less than 100. The distinction as to foreign parentage or mixed parentage in 1900 is available by sex for only 40 of the principal cities at that census.

* Ratios for 1910 and 1900 based upon population of Norwalk town, with which city has been made coextensive since 1910.

SEX DISTRIBUTION.

119

TABLE 8.—SEX DISTRIBUTION, 1920, AND RATIO OF MALES TO FEMALES, 1920, 1910, AND 1900, BY POPULATION CLASSES, FOR CITIES HAVING, IN 1920, 25,000 INHABITANTS OR MORE—Continued.

¹ Ratio not shown where number of females is less than 100. The distinction as to foreign parentage or mixed parentage in 1900 is available by sex for only 49 of the principal cities at that census.² Ratios for 1910 and 1900 based upon combined population of Winston city and Salem town, consolidated as Winston-Salem city since 1910.

POPULATION.

TABLE 8.—SEX DISTRIBUTION, 1920, AND RATIO OF MALES TO FEMALES, 1920, 1910, AND 1900, BY POPULATION CLASSES, FOR CITIES HAVING, IN 1920, 25,000 INHABITANTS OR MORE—Continued.

CITY AND CLASS OF POPULATION.	Male: 1920	Female: 1920	MALES TO 100 FEMALES. ¹			CITY AND CLASS OF POPULATION.	Male: 1920	Female: 1920	MALES TO 100 FEMALES. ¹
