CHAPTER IV.—MARITAL CONDITION.

INTRODUCTION.

Inquiry regarding marital condition was made for the first time at the Federal census of 1880, but the results were not tabulated. The earliest Federal statistics on the subject, therefore, are those for 1890.

The terms "married," "widowed," and "divorced" refer only to the marital status of the population at the time when the census was taken. A person who has been widowed or divorced but has remarried is reported as married, so that the returns for widowed and divorced persons do not represent the total number of living persons who have been widowed or divorced. Moreover, it is probable that some divorced persons are erroneously reported as single, some as married, and some as widowed, so that the census returns understate somewhat the actual number of divorced persons who have not remarried.

The number of persons under 15 years of age who are married, widowed, or divorced is naturally insignificant. The statistics on marital condition, therefore, usually relate only to persons 15 years of age and over, but in some of the tables figures are given also for persons under 15 years of age.

For a small number of persons the marital condition was not ascertained by the enumerators. In some of the tables no figures are given for these persons, but they are in all cases included in the totals on which are based the percentages single, married, widowed, and divorced. These percentages would not be appreciably different, however, if based exclusively upon the number of persons whose marital condition was reported, as the number for whom information on this subject was not secured amounted to only a little more than one-fifth of 1 per cent of the total population 15 years of age and over.

Other things being equal, the proportion married in the total population will be greater in a community where the sexes are numerically equal than in one where either sex outnumbers the other. In the latter case it is obvious that a larger number of persons of the sex which is in excess will remain single. Considering one sex alone, however, it is evident that the probability of marriage will increase as that sex falls below and will decrease as it rises above a numerical equality with the other sex.

The statistics on marital condition presented here are limited to continental United States. Those for the outlying possessions enumerated at the Fourteenth Census are presented in the sections pertaining to those possessions in Volume III of the Fourteenth Census Reports.

UNITED STATES AS A WHOLE.

Total population.—The excess of men over women in the adult population of the United States has a most important bearing upon the statistics of marital condition and accounts in part for the fact that the number of single men exceeded by 3,350,663 the number of single women. A further explanation of this disparity, however, is found in the tendency of men to marry at later ages than women, so that there would be more single men than single women in a population in which the sexes were numerically equal.

In the total population the number of married men exceeded the number of married women by 530,333. This condition is due in the main to the presence in the United States of many foreign-born married men who had left their wives in their home countries.

The excess of widows over widowers is probably due in some measure to more frequent remarriages among men than among women, and to the greater longevity of women than of men; but without doubt the principal cause of this excess is the fact that men usually marry at later ages than women, so that in the majority of cases the marriage relation is broken by the death of the husband rather than by the death of the wife. In other words, the excess of single men over single women has as a natural correlative an excess of widows over widowers. (See Table 2.)

Color or race, nativity, and parentage classes, by age.—No satisfactory analysis of statistics on marital condition can be made without considering age composition. In a population in which the sex distribution is normal, the proportion which the number of persons who are or have been married forms of the total number of adults depends on three factors: (1) The age at which marriage takes place, (2) the age distribution of the population, and (3) the number who permanently remain single. As a rule, the first and second factors have greater weight than the third in causing the differences which appear in the statistics for different classes or communities. In all cases the proportion of married, widowed, or divorced persons combined is smaller among young than among older persons; consequently differences between classes or communities in regard to the proportion married, widowed, or divorced in the total number of adults may result merely from differences in age distribution and may not appear when comparisons are confined to specific age groups.

The distribution according to marital condition varies considerably among the several classes of the native

population, and the distribution of the foreign-born population differs materially from that of the native classes, both because of its abnormal age composition and because of its marked excess of males over females. (See Table 3.)

Naturally the excess of single men over single women is most pronounced in those classes in which the ratio of males to females is highest, namely, the foreign-born whites and the native whites of native parentage. In the case of the foreign-born white population 15 years of age and over in 1920 the number of single males was more than twice as large as the number of single females. (See Table 2.)

The statistics give no direct information with regard to intermarriage among the several classes of the white population. In view of the fact that these classes intermarry more or less, there is not necessarily an approximate equality between the number of married men and the number of married women within any one class.

In each class of the white population, and also among the Negroes, the number of widows was more than twice as large as the number of widowers, from causes already noted with respect to the total population; and for each native white class and for Negroes an excess of divorced women over divorced men is shown. This excess of divorced women is due, of course, to the greater frequency of remarriage among divorced men.

It will be noted that the proportion married was considerably smaller for each sex among the native whites of foreign or mixed parentage than among the native whites of native parentage. This difference, which appears for each age group and for each individual year of age for which figures are presented, is due in some measure, but not wholly, to the facts that a much larger proportion of native whites of foreign or mixed parentage than of native whites of native parentage live in urban communities and that in general the proportion married is smaller in the urban than in the rural population.

Although the total foreign-born white male population 15 years of age and over shows a larger percentage of married men than the corresponding total in the native white population of native parentage, the percentages of married men in the latter class are found to exceed those in the former when the comparison is made for specific age groups or individual years of age.

Among the Chinese and Japanese the proportions of married men are smaller and of married women are larger than among the native whites of native parentage, the Negroes, or the Indians. The proportion married is especially small among the Chinese men and especially large among the Japanese women. The abnormal distribution of the Chinese and Japanese population according to marital condition is due

to the facts that most of the Chinese and Japanese in the United States are immigrants, and that among these immigrants the males greatly outnumber the females. (See Tables 2 and 3.)

DIVISIONS AND STATES.

Considerable differences in marital condition are found when one section of the country is compared with another, not only when the comparison is made with regard to the population as a whole but also when particular classes are taken into consideration. The marital condition of each sex in the total population of a given division or state may be materially affected by the sex, age, color or race, nativity, and parentage composition of the total; and in the case of any particular class the marital condition of each sex may be materially affected by the sex and age composition of the class or, when intermarriage between classes is common, of the total population within the division or state.

The marital condition of the total population or of any class may be affected by interstate migration, both directly by differences between persons of different marital classes in regard to the disposition to migrate, and indirectly through the influence of migration upon sex and age distribution. There are no statistics bearing specifically on this point, but it may be presumed that unattached persons—single men and women or widowed or divorced persons without children—are more likely to migrate than those with families. This being the case, and other things being equal, relatively fewer unmarried persons will be found in states and divisions which lose more than they gain through interstate migration than in those which gain more than they lose.

Another factor affecting marital condition in divisions and states as compared with one another is the relative importance of urban population. The sex and age distribution of the urban population differs from that of the rural population, and the proportion of unmarried persons is larger, as a rule, especially among women, in cities than in rural communities. A state in which the proportion of urban population is large is, therefore, likely to have a somewhat larger proportion of single persons in its adult population than a state which is predominantly rural.

The marital condition of the foreign-born population of the several states depends to some extent upon the period of time during which immigration has been most rapid and is influenced by differences among the countries which have contributed chiefly to the foreign-born population. The period of time at which immigration has been most rapid also indirectly affects the marital condition of the natives of foreign or mixed parentage, since it affects the age distribution of that class.

Thus the causes of differences among the divisions or states in regard to marital condition are exceedingly complex, and in some cases conflict with one another. For example, the effect of a relatively large number of young persons in the adult population of a certain division or state, which would tend to reduce the proportion married in the total adult population, may be offset by the presence of a relatively large rural population, in which the proportion of married persons is generally larger than in the urban population.

PRINCIPAL CITIES.

Statistics for the 68 cities having 100,000 inhabitants or more in 1920 are presented, in Tables 12 to 16, inclusive, in substantially the same detail as those given in Tables 6 to 11 for geographic divisions and states; while for the 219 cities having 25,000 to 100,000 inhabitants a less detailed presentation is made in Table 17.

Differences in marital condition among the cities result from the same causes which operate to produce differences among the states. The marital condition of each sex in any city is influenced in large measure by the sex and age distribution and the racial composition of the population.

URBAN AND RURAL COMMUNITIES.

Since marked differences exist between urban and rural communities in regard to the composition and marital condition of their population, separate statistics are given for the two classes of communities in Tables 18 to 23. In drawing the distinction between urban and rural population, all incorporated places (and all towns in Massachusetts, Rhode Island, and New Hampshire) having 2,500 inhabitants or more are treated as urban and the remainder of the country as rural.

In Massachusetts and Rhode Island it is not the practice, as in practically all the other states, to incorporate, as separate municipalities, the relatively densely populated portions of "towns" (which are the primary divisions of the counties), and no town as a whole is incorporated as a municipality until it attains a population greatly in excess of 2,500; and in New Hampshire a similar condition exists, although the state contains two incorporated villages, each of which has fewer than 2,500 inhabitants. For this reason those towns having 2,500 or more inhabitants in the three states named are treated as urban, although portions of their areas are rural in character. The urban areas in the three states in question, as classified by the census, thus contain relatively small numbers of inhabitants who in other sections of the country would be segregated as rural. Nevertheless, in most of the towns having 2,500 inhabitants or more in Massachusetts, Rhode Island, and New Hampshire by

far the greater part of the population resides within the more densely settled areas, so that the proportion classed as urban, considering each state as a whole, is not greatly exaggerated by the practice adopted.

In the case of every population class covered by the statistics, marriage, on the part of women, is less common or is deferred longer in cities than in rural communities. For all classes of the male population combined, and for each class considered separately, except the foreign-born white men, the tendency is in the same direction but is much less pronounced. Basing the comparison on all classes of the population combined, the proportion of married males 15 years of age and over was only slightly larger in 1920 in rural territory than in urban territory, whereas for women the corresponding difference was considerable. This condition is due, wholly or in part, to the fact that the ratio of males to females is considerably higher in rural than in urban communities, there being an actual excess of females in many cities. (See Table 21.)

It will be noted by reference to Tables 21 and 22 that the percentage of married males in the combined age group 15 to 24 in the native white population of native parentage was slightly larger in urban than in rural communities, although the age periods 15-19 and 20-24, considered separately, show larger percentages for rural than for urban communities. The explanation of this apparent contradiction lies in the fact that persons in the age period 15-19, among whom the proportion married is small, are relatively more numerous in rural than in urban communities. As a result, the proportion married in the combined group 15-24 is reduced by the inclusion of the 15-19 group to a greater extent in rural than in urban communities.

It will also be noted that for all classes of the male population combined the percentage married in the combined 15-24 group was larger in rural than in urban communities, whereas for each population class shown in the table, considered separately, the corresponding percentage was larger in urban than in rural communities. The paradoxical condition is due to the facts that the proportion of married persons 15 to 24 years of age is much smaller for the native white population of foreign or mixed parentage than for any other class covered by the table, and that persons of this class are much more numerous in urban than in rural communities, whereas the number of males 15 to 24 years of age in all classes of the population combined differ but slightly as between urban and rural communities. The inclusion of a relatively large number of native white males of foreign or mixed parentage in the urban population 15 to 24 years of age, together with the inclusion of a much smaller number of such males in the rural population, therefore, reduces the proportion of married persons in the total male population 15 to 24 years of age to a greater extent in urban than in rural communities.

MARITAL CONDITION OF THE POPULATION 15 YEARS OF AGE AND OVER, BY SEX AND AGE PERIODS, FOR PRINCIPAL POPULATION CLASSES: 1920.

MARITAL CONDITION.
