# CHAPTER VII.—YEAR OF IMMIGRATION OF THE FOREIGN-BORN POPULATION.

#### INTRODUCTION.

The inquiry as to year of immigration supplies a basis for a comparison of the several geographic divisions and states in regard to the distribution of the foreign-born population by years of arrival in the United States. It also provides a means for determining what proportion of the immigrants who arrived during a given year or period of years, as shown by the immigration statistics, were still alive and residing in this country on the census date. This discussion does not cover the year of arrival of the foreign born who were enumerated in any of the outlying territories, but statistics for Alaska, Hawaii, and Porto Rico are given in the sections for those territories, in Volume III.

Data as to year of immigration have been collected at each of the last four decennial censuses. As the Fourteenth Census statistics show the numbers of surviving immigrants on January 1, 1920, who arrived in the United States during the periods 1906-1910 and 1901-1905, and in 1900 or earlier years, the statistics compiled from the returns of preceding censuses have little value for the purpose of comparison with those of the present census. Accordingly, the only comparative figures given are the Thirteenth Census statistics shown in Table 1. In that table the distribution of the immigrants for whom the year of arrival was not reported-about one-eleventh of the Fourteenth Census total and about one-tenth of the Thirteenth Census total—has been made on the assumption that the proportions arriving during each period of years were the same for the immigrants for whom the year was not reported as for those for whom data were secured. There is no way of determining whether the distribution thus made contains any considerable margin of error, but it is probably approximately correct.

In making use of the figures in Table 1, it must be remembered that the difference between the numbers of immigrants shown by the Thirteenth Census and by the Fourteenth Census as having arrived during a specified period, although due mainly to mortality, is affected to some extent by emigration of foreignborn persons.

It will be noted that the number shown by the Fourteenth Census as having arrived in 1900 or earlier was nearly one-fourth smaller than the corresponding number shown by the Thirteenth Census, whereas in the case of the group reported as having arrived

during the period 1901-1905 the reduction between the two censuses was less than one-ninth. This condition is presumably due mainly to the fact that during the period between the two censuses the average age of the immigrants who arrived in 1900 or earlier was materially higher than that of the immigrants who reached this country during the period 1901-1905, so that the mortality between the two censuses would be greater for the former group than for the latter. It may be also that the proportion of emigrants among the foreign-born persons who arrived in 1900 or earlier was larger than among those who came during the years 1901 to 1905.

During the calendar years 1914 to 1919, inclusive, and especially the years 1915 to 1919, immigration to the United States was greatly reduced as a result of the World War, and therefore the number of foreignborn persons enumerated in 1920 as having arrived during the years from 1915 to 1918, inclusive, shows a marked decrease for each year of arrival as compared with the preceding one, but the foreign born enumerated as having arrived in 1919—the year following the termination of the war—outnumbered those who arrived in 1915 and who were still in the United States in 1920. The considerable numbers of these later arrivals enumerated in Texas, Arizona, and California were mainly Mexicans. (See Table 4.)

In making comparisons between the census statistics as to the numbers of immigrants arriving during specified years and the immigration and emigration statistics published by the Bureau of Immigration, it must be remembered that the census figures relate to calendar years, while the immigration and emigration figures are for fiscal years ended June 30.

Urban and rural communities.—Because of the great difference between the proportions of immigrants who go to urban and to rural communities, and because of the changes in these proportions from decade to decade, separate statistics for the two classes of communities are given in Tables 15 and 16.

In drawing the distinction between urban and rural population, all incorporated places (and all towns in Massachusetts, Rhode Island, and New Hampshire) having 2,500 inhabitants or more are treated as urban and the remainder of the country as rural. In Massachusetts and Rhode Island it is not the practice, as in practically all the other states, to incorporate, as separate municipalities, the relatively densely populated

portions of "towns" (which are the primary divisions of the counties), and no town as a whole is incorporated as a municipality until it attains a population greatly in excess of 2,500; and in New Hampshire a similar condition exists, although the state contains two incorporated villages, each of which has fewer than 2,500 inhabitants. For this reason those towns having 2,500 or more inhabitants in the three states named are treated as urban, although portions of their areas are rural in character. The urban areas in the three states in question, as classified by the census, thus contain relatively small numbers of inhabitants who in other sections of the country would be segregated as rural. Nevertheless, in most of the towns having 2,500 inhabitants or more in Massachusetts, Rhode Island, and New Hampshire by far the greater part of the population resides within the more densely settled areas, so that the proportion classed as urban, considering each state as a whole, is not greatly exaggerated by the practice adopted.

It will be seen from Tables 15 and 16 that, considering the country as a whole, the foreign born in rural

districts represent, on the average, a somewhat older immigration than those in urban communities, although in some sections of the country the reverse is true. Naturally, as the opportunities for acquiring land at low prices decreased, immigration to rural communities decreased. Moreover, the demand for labor in industrial communities has been greater in recent than in earlier decades. The fact that all transoceanic immigrants land in cities and that some remain there for more or less extended periods of time, even if their intention is ultimately to settle in rural districts, also may have some effect on the distribution as between urban and rural communities.

It may be noted, however, that of the comparatively few immigrants who arrived during the period from 1915 to 1919 and who were still living in the United States on the census date, the proportion who went to rural communities, 27.1 per cent (excluding those for whom the year of immigration was not reported), was materially larger than the corresponding proportion, 23.5 per cent, among the immigrants who arrived prior to 1915.

### YEAR OF IMMIGRATION.
