CHAPTER I.—FARMS AND FARM PROPERTY.

Introduction.—This chapter gives the principal data relating to farms and farm property for each of the censuses from 1850 to 1920. The figures for 1920 and 1910 are presented somewhat more in detail than those for the earlier censuses, with percentages of increase, in order to give due emphasis to recent changes; but most of the important items are also shown for all of the census years beginning with 1850, the date of the first relatively complete census of agriculture in the United States.

the and the state of the second

The figures presented herewith relate to the area known as continental United States, comprising the 48 states and the District of Columbia. The totals for the United States as a whole are given in two summary tables, and statistics are presented in a series of detailed tables for the several states and for nine. geographic divisions or groups of states. These divisions are made up for the most part of states having many characteristics in common, and the statistics presented in this form afford a basis for comparisons between areas larger than the individual states.

The data relating to farms and farm property, which are presented in this chapter as simple totals, are classified in various ways in other chapters, as follows: Chapter II, "Size of Farms"; Chapter III; "Farm Tenure"; Chapter IV, "Farm Statistics by Color and Tenure of Farmer"; Chapter V, "Farm Statistics by Race, Nativity, and Sex of Farmer"; and Chapter VII, "Farm Mortgages." The number of farms (or of farmers) alone is further classified in Chapter VI, "Farm Operators by Age, Number of Years on Farm, and Farm Experience."

Population.—The population of the United States on January 1, 1920, was 105,710,620, as compared with 91,972,266 on April 15, 1910, these figures representing an increase of 13,738,354, or 14.9 per cent. Of the total population in 1920, 51,406,017, or 48.6 per cent, were classified as rural, while in 1910 the rural population formed 54.2 per cent of the total. There has been a gradual decrease in the percentage of the population classified as rural since the classification was established by the Bureau of the Census. In 1920, however, for the first time, the rural population formed less than one-half of the total.

Rural population, as defined by the Bureau of the Census, is the population residing outside of incorporated places having 2,500 inhabitants or over. It is evident that the population thus classified includes much more than the farming population. There is, however, a closer relation between the rural population and the number of farms, for example, than there is between the total population and any of the agricultural data.

and the event of the period

Farms and farm acreage: 1920 and 1910.—There were in the United States on January 1, 1920, 6,448,343 farms,¹ containing 955,883,715 acres, of which 503,-073,007 acres were improved, and 452,810,708 acres unimproved. Of this latter acreage 167,730,794 acres were reported as woodland and 285,079,914 acres as other unimproved land.

e e l'anna a firte à Elegan de Cherner

The census classification of farm land as "improved land," "woodland," and "other unimproved land" is one not always easy for the farmers or the enumerators to make, and the statistics must therefore be considered at best only a close approximation. The definitions of the three classes, as given to the enumerators, were substantially as follows:

Improved land includes all land regularly tilled or mowed, land in pasture which has been cleared or tilled, land lying fallow, land in gardens, orchards, vineyards, and nurseries, and land occupied by farm buildings.

Woodland includes all land covered with natural or planted forest trees which produce, or later may produce, firewood or other forest products.

Other unimproved land includes brush land, rough or stony land, swamp land, and any other land which is not improved or in forest.

A summary of the principal items from the census of agriculture for the United States as a whole for the years 1920 and 1910 is presented in Table 1, which also indicates the amount and percentage of increase for the intervening decade.

The land in farms in 1920 represented 50.2 per cent, or slightly more than one-half, of the total land area of the country. The improved land, which formed 52.6 per cent of the farm land, represented only a little over one-fourth (26.4 per cent) of the total land area of the country. The average size of the farms in the country as a whole was 148.2 acres and the average acreage of improved land per farm was 78.

That part of the total land area not in farms is occupied by mountains, deserts, mining property, forests, swamps, roadways, cities, country estates, etc. A part of this land is now used for range pasture; a part may be converted into farms by inclosure or by clear-

. .

¹ A "farm" for census purposes is all the land which is directly farmed by one person managing and conducting agricultural operations, either by his own labor alone or with the assistance of members of his household or hired employees. The term "agricultural operations" is used as a general term, referring to the work of growing crops, producing other agricultural products, and raising domestic animals, poultry, and bees. A "farm" as thus defined may consist of a single tract of land or of a number of separate and distinct tracts, and these several tracts may be held under different tenures, as where one tract is owned by the farmer and another tract is hired by him. When a landowner has one or more tenants, renters, croppers, or managers, the land operated by each is considered a "farm."

In applying the foregoing definition, enumerators were instructed to report as a "farm" any tract of 3 or more acres used for agricultural purposes, and also any tract containing less than 3 acres which produced at least \$250 worth of farm products in the year 1919, or required for its agricultural operations the continuous services of at least one person. (23)

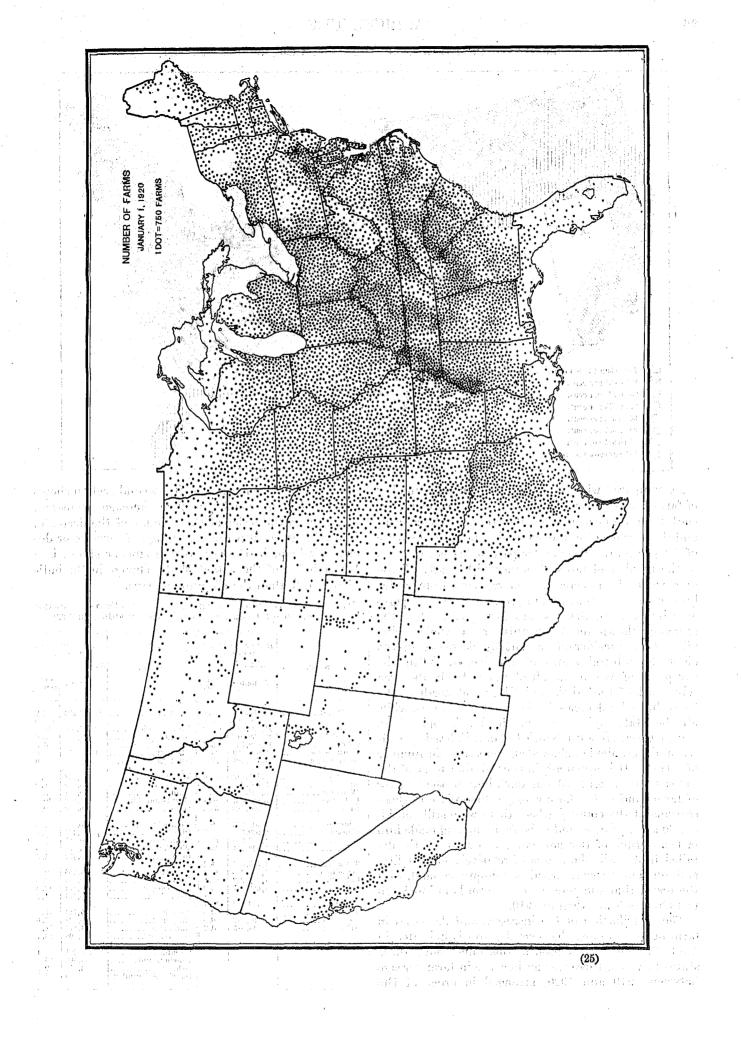

ing, drainage, or irrigation, but a much larger part can never be used for agricultural purposes. The acreage of improved land in farms constitutes a somewhat better index of the agricultural development of

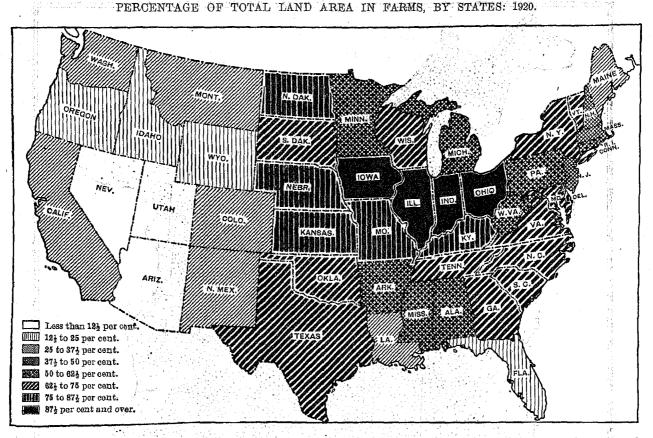

the country than does the total farm acreage, though much of the unimproved land in farms, including a part of the woodland, serves a useful agricultural purpose as pasture for live stock. An and the succession

¹ A minus sign (-) denotes decrease. ² Population residing outside of incorporated places having 2,500 inhabitants or over. Towns in New Hampshire, Massachusetts, and Rhode Island were included with incorporated places in making this classification. The rate of increases in the rural population between the two consuses is affected somewhat by the fact that certain places classified as rural in 1910 had become urban by 1920. The population in 1910 of the territory classified as rural in 1920 was 48,779,082. For this territory, the increase in population between 1910 and 1920 was 48, results territory, the increase in classified as rural in 1920 was 48,779,082. For this territory, the increase in fleation of territory. ³ Decrease in land area due to the building of the Pathfinder and Shoshone Reservoirs in Wyoming and several reservoirs for irrigation projects in Montana. ⁴ Lees than one-tenth of 1 per cent decrease. ⁵ These figures include the value of fences, tile drains, and other incidental improvements on the land, excluding only the value of buildings.

 $\mathbf{24}$

As compared with the figures for 1910, the number of farms reported for 1920 shows an increase of 1.4 per cent, the total farm acreage an increase of 8.8 per cent, and the acreage of improved land in farms an increase of 5.1 per cent. The greater part of the net increase in the number of farms, together with nearly all the increase in farm acreage, was reported from states lying west of the Mississippi River. In fact, the aggregate increases in these states were greater than the increases shown for the country as a whole, being offset to a considerable extent by decreases in the older agricultural states of the North. With the exception of Wisconsin, all of the states in the area lying east of the Mississippi River and north of the Ohio showed a decrease in the number of farms, while all the states lying west of the Mississippi River, except Iowa, Missouri, South Dakota, Nebraska, Kansas, and New Mexico, showed an increase in the number of farms. It is apparent, in general, that most of the increases between 1910 and 1920, both in the number of farms and in the farm acreage, took place in those sections of the country where there were still considerable areas of new land to be taken up and made into farms. Much of this new land, as a study of the detailed tables will show, was of relatively low quality, and much of it was returned as unimproved land, with the result that the percentage of farm land improved in 1920 was lower than in 1910.

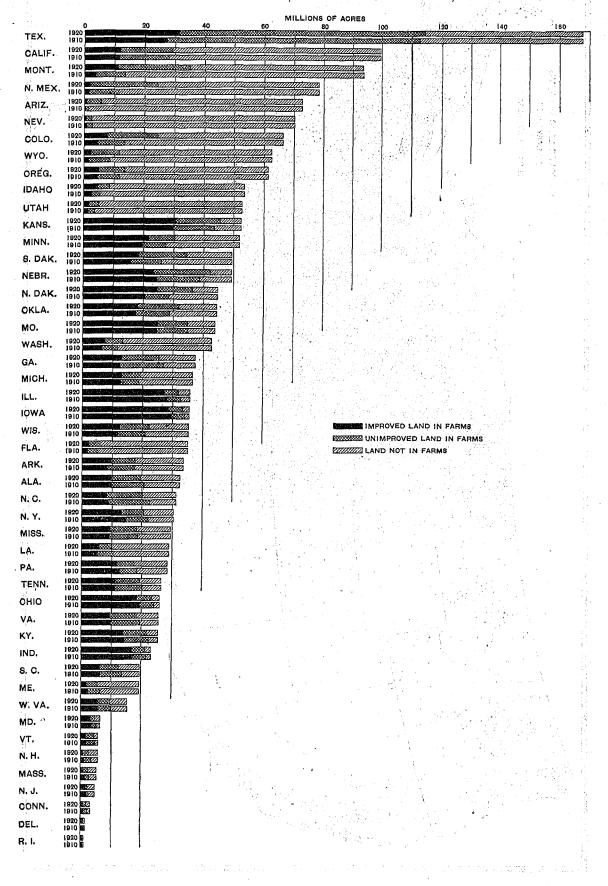

The distribution of the increases and decreases in farm acreage among the several states is indicated in Table 2. The first section of this table shows those states in which there was an increase in farm acreage between 1910 and 1920, arranged in order of the amount of the increase, and the second section shows those states in which the farm acreage decreased, arranged in the order of the amount of the decrease. The table gives also the percentage of increase or decrease, which, in the case of the smaller states, is a better index of the extent of the change in the individual state than the absolute acreage.

(28)

It appears from the returns of the enumerators and from information secured otherwise that a considerable number of tracts of farm land in certain parts of the country lay idle during the season of 1919 on account of the scarcity of farm labor;¹ and because they were not operated during 1919, some of these tracts were not returned as farms at the census of 1920. It is believed that the area of farm land which was thus temporarily abandoned for agricultural purposes was too small to form any material percentage of the total farm acreage in the United States as a whole. It may have been large enough, however, to account for what would seem otherwise unduly large decreases in certain states or counties.

Value of farm property: 1920 and 1910.-The total value of all farm property in 1920 amounted to \$77,924,100,338, as compared with \$40,991,449,090 in 1910, the increase amounting to \$36,932,651,248, or 90.1 per cent. Of the total value of all farm property in 1920 the value of land and buildings represented 85.1 per cent; of implements and machinery, 4.6 per cent; and of live stock, 10.3 per cent. The percentage represented by the value of land and buildings was practically the same in 1920 as in 1910, while the percentage represented by implements and machinery was somewhat larger and that represented by live stock somewhat smaller. The relative increase between 1910 and 1920 was greatest in the value of implements and machinery and smallest in the value of live stock, which may be explained in part by the increasing use on farms of automobiles, tractors, and motor trucks.

The great increases in farm values indicated by the returns of the 1920 census resulted mainly from the very high prices at which farm property of all kinds was held at the beginning of the year 1920. It is interesting to note, however, that even with the abnormally high valuation which prevailed in many localities at the time the Fourteenth Census was taken, the relative increase in the value of farm property for the decade (90.1 per cent) was less than the increase between 1900 and 1910, which amounted to 100.5 per cent.

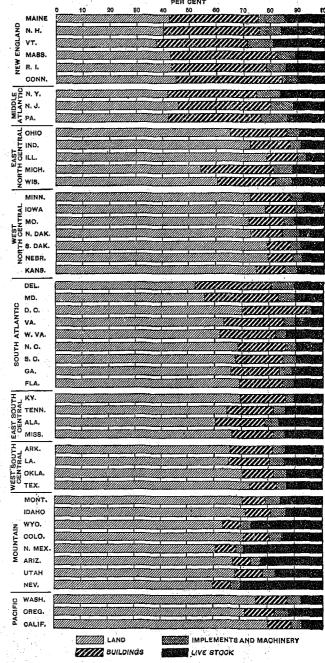

The average value of all farm property per farm in 1920 amounted to \$12,084, as compared with \$6,444 in 1910. The average value of land and buildings per farm in 1920 was \$10,284; of implements and machinery, \$557; and of live stock, \$1,243.

The average value of all farm property per acre of

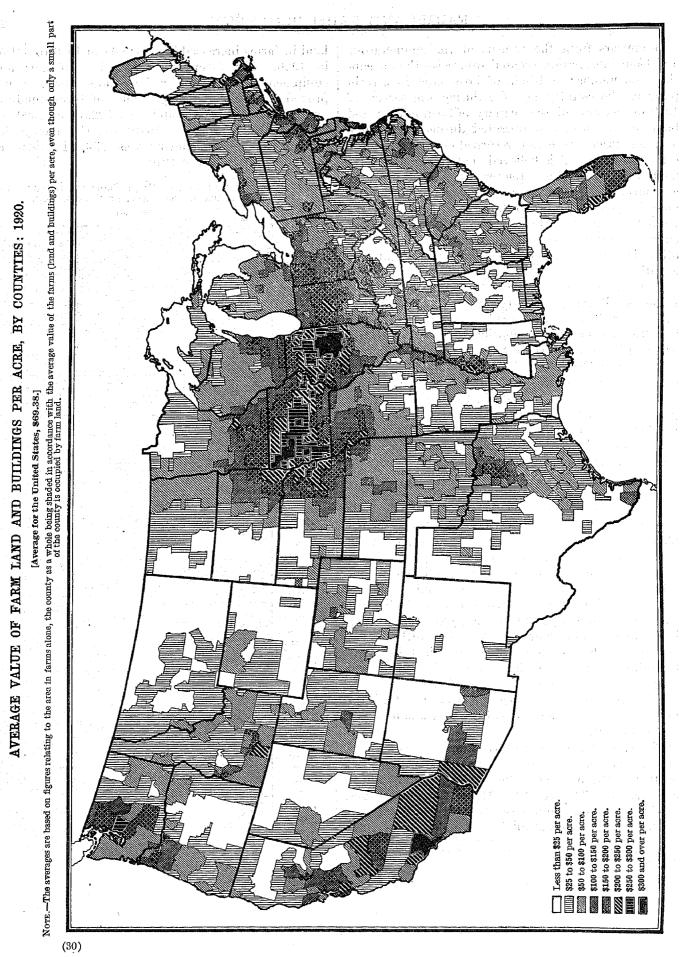

¹ See Appendix B, "Extracts from supervisors' correspondence relative to decrease in farms."

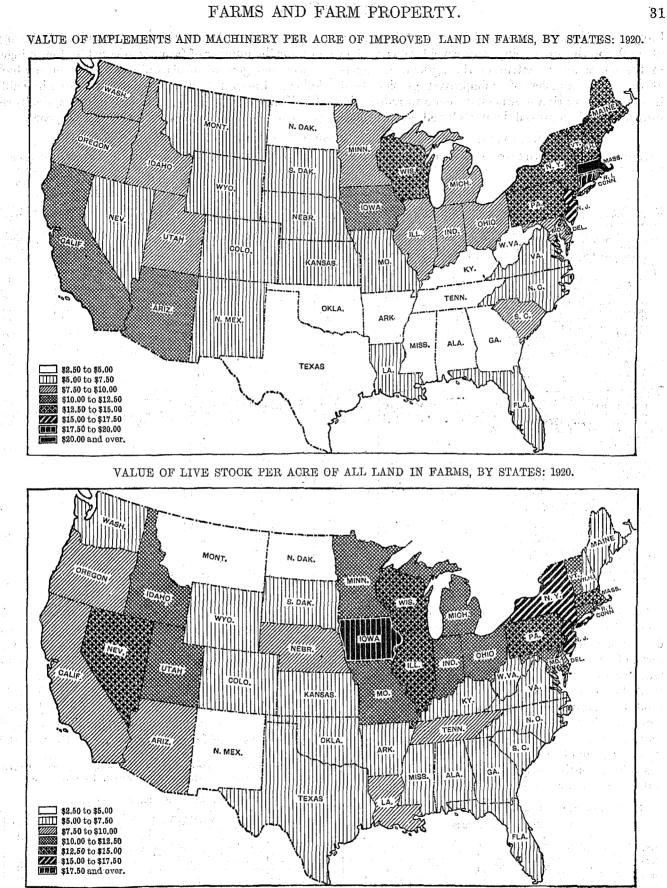

land in farms increased from \$46.64 in 1910 to \$81.52 in 1920. The farm investment in buildings and equipment is chiefly utilized in connection with improved land. The average value of farm buildings per acre of improved land was \$22.83 in 1920, as compared with \$13.22 in 1910; and the average for implements and machinery was \$7.15 in 1920, as compared with \$2.64 in 1910.

 $\mathbf{29}$

Farms and farm acreage: 1850 to 1920.-In considering the agricultural statistics from 1850 to 1920, as presented in Table 3, it should be noted that some of the figures are not entirely comparable over the whole range of time represented. For example, in some of the Western states land which was formerly public range, and as such was utilized more or less extensively for grazing, has from time to time been

brought under private ownership without involving, at least for the time being, any considerable change in the character or extent of the agricultural operations. The transfer of unimproved grazing land from public to private ownership tends to reduce the proportion of improved land included in the total farm acreage. Again, the comparability of the figures for the number of farms is affected by the changes in the management of plantations in the South which followed the Civil War. The data presented in Table 3 indicate in a broad way, however, the agricultural progress of the country during the past 70 years.

There has been an increase in the number of farms and in the amount of farm land in the United States during each decade since 1850. The opening to settlement of vast areas of new land since 1850 has caused a westward migration of farmers to take up this frontier land, but the available supply of the more desirable land has been steadily diminishing, so that dating from 1900 further additions to the farm area have been at a much slower rate. At the same time the breaking up of large plantations in the South since the Civil War has added continuously to the number of farms without a corresponding increase in the farm acreage.

MILLIONS OF FARMS

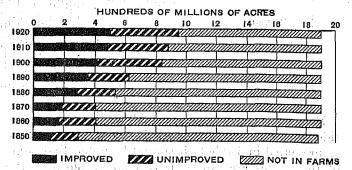

- Alto

In 1850 only 15.6 per cent of the total land area in the United States was in farms; in 1920, 50.2 per cent. In 1850 only 6 per cent of the total land area was classified as improved farm land; in 1920, 26.4 per cent.

The number of farms reported in 1850 was 1,449,073, while in 1920 the number had increased to 6,448,343. The number of farms increased more rapidly than the farm acreage, resulting in a material decrease in the average size of farms especially from 1860 to 1880.

IMPROVED AND UNIMPROVED LAND IN FARMS IN THE UNITED STATES, AND LAND NOT IN FARMS: 1850 TO 1920.

In 1850 only 38.5 per cent of the land in farms was improved, while in 1920, 52.6 per cent was improved. This percentage represents a slight decrease, as compared with 1910.

Value of farm property: 1850 to 1920.—The value of all farm property and that of the various classes of property has increased much more rapidly than the number of farms or the amount of all land or of improved land in farms, especially during the two decades since 1900. The value of all farm property in 1850 was \$3,967,343,580; for the next five decades, the value increased gradually, until the amount in 1900 was \$20,439,901,164. In the single decade between 1900 and 1910, the value of farm property slightly more than doubled, standing in 1910 at \$40,991,449,-090; and again between 1910 and 1920 it almost doubled, the 1920 total being \$77,924,100,338.

While there was a considerable decrease in the average size of farms between 1850 and 1920, the average value of farm property per farm increased materially—from \$2,738 in 1850 to \$12,084 in 1920.

The average value of all farm property per acre of land in farms increased from \$13.51 in 1850 to \$81.52 in 1920, while the average value of land and buildings per acre increased from \$11.14 to \$69.38.

The average value of farm real estate per acre forms perhaps the best available index of the increase in the valuation of farm property, as distinguished from the increase in the physical quantity of such property. There have been considerable variations in the average quality of the land reported and in the nature of the farm buildings, especially when comparisons are made between census years separated by several decades. Particularly since 1900, however, there have been no very great changes of this kind and the increase in the value of farms per acre from \$19.81 in 1900 to \$69.38 in 1920-an increase

88735°---22-----3

of 250 per cent—represents roughly the increase in the valuation in dollars and cents of property approximately identical in its physical characteristics.

It has been generally assumed that one of the most important factors in the increase in the value of farm land per acre was the increase in the pressure of population on the land. On the basis of the figures in Table 4, it is possible to make an interesting comparison of these two factors as they appear in the statistics for the United States from 1850 to 1920. Computing the number of inhabitants per 1,000 acres of improved farm land, rather than the number of acres of land per capita, in order to obtain an index which should vary directly rather than inversely with the price of farm land, we find that in 1850, when the average value of farms per acre was \$11.14, there were 205 inhabitants per 1,000 acres of improved. farm land in the country, while in 1910, when the value of farms per acre had risen to \$39.60, there were only 192 inhabitants per 1,000 acres of improved farm land—even fewer than in 1850, when the price of farm land was only a little over one-fourth as great. Again in 1920, when the price of farms per acre had risen to \$69.38, the number of inhabitants per 1,000 acres of improved farm land was 210, or slightly greater than in 1850 when the price of farm land was less than one-sixth of what it was in 1920.

Tables for divisions and states.—In Tables 5 to 17, inclusive, the major part of the data which have been summarized in Tables 1 and 3, above, are presented by geographic divisions and states. In some instances minor items have been omitted altogether by reason of the limitation of space. Whatever explanation or comment has been made with regard to the figures for the United States as a whole will also apply, in general, to figures for divisions and states.

A study of the figures as here presented by divisions and states will, in many cases, suggest an explanation for a change or a tendency which appears simply as a stated fact in the summary for the United States as a whole. In order to expedite the publication of the figures themselves, however, it has been thought best not to attempt any detailed analysis of these tables in the present report. te st te

¹ Approximate land area in 1861 shown for 1860. ² North Dakota and South Dakota admitted as states in 1889. Figures for 1880 obtained by consolidating data for the counties which then occupied the areas now known as North and South Dakota, respectively. ³ The 1870 and 1860 figures are for Dakota Territory. Approximate land area in 1861 shown for 1860.

TABLE 7.—POPULATION, NUMBER OF FARMS, TOTAL LAND AREA, AND ACREAGE OF ALL LAND IN FARMS AND OF IMPROVED LAND IN FARMS, BY DIVISIONS AND STATES: 1850 TO 1920—Continued.

[A minus sign (---) denotes decrease.]

1 North Dakota and South Dakota admitted as states in 1889. Figures for 1880 obtained by consolidating data for the counties which then occupied the areas now known as North and South Dakota, respectively. * Figures for 1870 and 1860 are for Dakota Territory.

TABLE 13.-VALUE OF ALL FARM PROPERTY AND OF THE SEVERAL CLASSES, BY DIVISIONS AND STATES:

a configures for 1870 are computed gold values, being 80 per cent of the currency values reported. A minus sign (--) denotes decrease.]

¹ Figures for 1900 include Indian Territory, ² The 1800 figures for value of live stock include Indian Territory; those for land and buildings and implements and machinery are for Oklahoma Territory alone, no data being available for Indian Territory. ³ Figures for 1880 are fer Indian Territory.

TABLE 13. VALUE OF ALL FARM PROPERTY AND OF THE SEVERAL CLASSES, BY DIVISIONS AND STATES:

[Figures for 1870 are computed gold values, being 80 per cent of the currency values reported. A minus sign (-) denotes decrease. Per cent not shown when more than 1,000.]

CHAPTER II.-SIZE OF FARMS.

Introduction.—This chapter presents the statistics of farms and farm property (including live stock) collected at the 1920 census, classified according to the size of farms. Comparative figures for 1910 are given for most of the items; and the number of farms classified according to size is given for the different censuses beginning with 1880. The size classification used in the censuses of 1860 and 1870 was based upon the area of improved land rather than upon the total farm acreage, so that no comparative data are available for censuses prior to 1880.

In order to simplify the statistics, the three groups into which farms of less than 20 acres were divided in the last three censuses have been consolidated in most of the tables, the group comprising farms of 175 to 259 acres has been combined with that comprising farms of 260 to 499 acres, and the two 1920 groups comprising farms of 1,000 acres and over have been combined.

In adopting the size classification which has been used in the censuses of 1900, 1910, and 1920, the Bureau of the Census took into account the fact that in large sections of the country the boundaries of many farms correspond more or less closely to the Government surveys of public lands. Government land has for the most part been sold or otherwise disposed of in quarter-sections of 160 acres or approximately that amount; and where these have been broken up, they have commonly been divided into "quarterquarters" or 40-acre tracts. The greater number of farms, therefore, in a large part of the country contain either 160 acres or some other multiple of 40 acres. In making any extensive study of the classification of farms in the United States by size, account must be taken of the geographic distribution of the farms of the different size groups. It will be found, for example, that most of the small farms are in the East and the South, while most of the very large farms are in the West, especially in the Mountain states. The brief references to the outstanding features of the United States totals, which form a part of the following paragraphs, are designed to be merely suggestive and to be supplemented by an examination of the detailed figures presented in the tables for divisions and states.

Number and acreage of farms, by size: 1920 and 1910,-More than two-thirds (68.7 per cent) of the farms in the United States in 1920 were between 20 and 175 acres in size. These farms were divided almost equally among three groups, from 20 to 49 acres, from 50 to 99 acres, and from 100 to 174 acres, respectively. The most important changes between 1910 and 1920 in the distribution of farms by size, as shown for the United States as a whole, were an increase in the number of farms in the two groups comprising farms of 500 acres and over, an increase in the number of farms from 20 to 49 acres, and a decrease in the number of farms from 100 to 174 acres. These changes in the size groups are much more significant when considered in detail by divisions and states. The average number of acres of all land per farm increased from 138.1 in 1910 to 148.2 in 1920, and the average acreage of improved land from 75.2 to 78.

¹ Less than one-tenth of 1 per cent.

The distribution of the total acreage of the farms among the size groups is, of course, radically different from the distribution of the number of farms. Of the seven main groups shown in Table 2, the one comprising farms from 175 to 499 acres represented the largest percentage of the total acreage (namely, 29 per cent), although the farms in this group formed only 15.6 per cent of the total number of farms. The group comprising farms of 1,000 acres and over represented only 1 per cent of the total number of farms, but contained 23.1 per cent of the total farm acreage in 1920.

As might be expected, the percentage of farm land improved decreases as the size of the farm increases. In 1920, of the land in farms containing less than 20 acres, 89.8 per cent was improved, while the proportion was only 47.7 per cent for farms of 500 to 999 acres, and only 17.1 per cent for farms of 1,000 acres and over. The low percentage shown for the very large farms is due, in part, to the fact that most of these farms are in regions where agriculture is not yet very highly developed, and to the inclusion of large areas of grazing land and of rough land not suitable for cultivation.

Number of farms, by size: 1880 to 1920.—The classification of farms according to size in 1880 and 1890 was somewhat different from that employed in 1900 and thereafter. Hence, in order to make comparisons, certain combinations of groups are required. Comparative figures for the censuses from 1880 to 1920, with the necessary rearrangement of groups, are presented in Table 3.

control to and drawning in and a 7.3

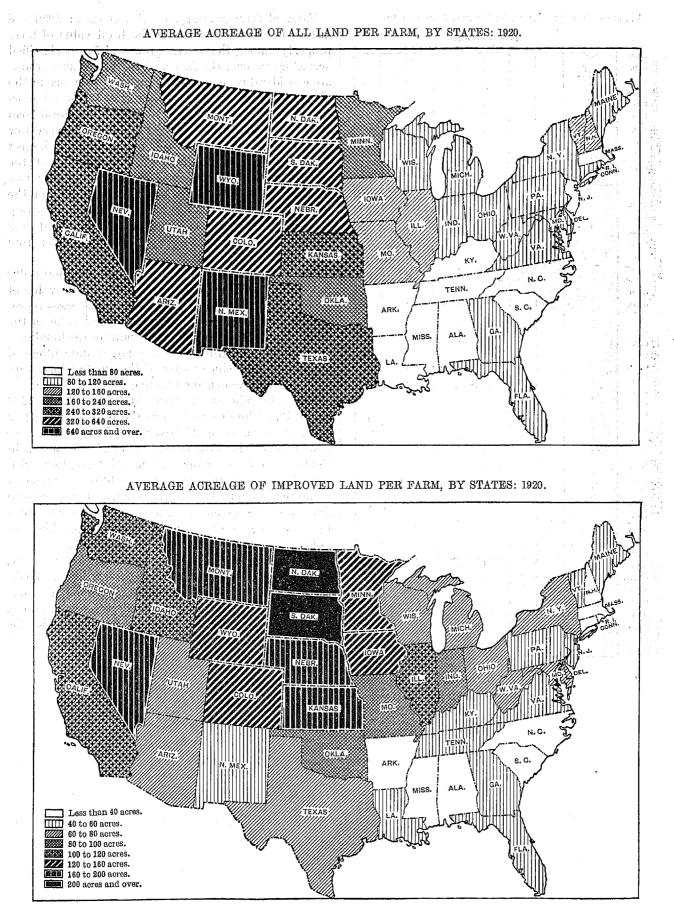

There have been slight changes from census to census in the instructions to the enumerators with regard to reporting very small farms, which changes doubtless affect somewhat the comparability of the figures for farms under 3. acres. In the census of 1900 in particular, the instructions were such that relatively large numbers of farms less than 3 acres in size were reported. In considering the figures for the very large farms, also, some allowance should be made for the fact that the amount of public land in use for grazing purposes has been gradually decreasing since 1880. The absorption of this land into farms (sometimes with little change in its use for agricultural pur-

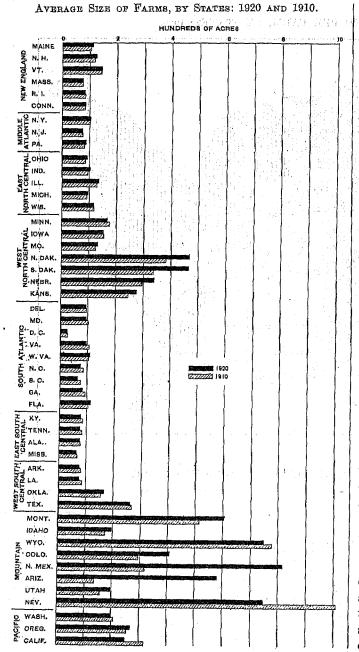

166)

poses) is partly responsible for the increase in the relative number of farms in the larger size groups.

Average size of farms: 1850 to 1920.—While farms were classified according to size on the basis of their total acreage for the first time at the census of 1880, figures representing the average number of acres per farm are available for the several censuses beginning with 1850. These averages were as follows:

	<u></u>				<u>/ </u>	
CENSUS YEAR.	Acres.	CENSUS YEAR.	Acres.	CENSUS YEAR.	Acres.	CENSUS YEAR. Acres.
1850 1800	202.6 199.2	1870 1880	153.3 133.7	1890 1900	$136.5 \\ 146.2$	1910
1.2.11		1		(·		the tendent and the

Value of farm property, by size of farm: 1920 and 1910.-In the distribution of the total value of farm property among the several groups of farms classified according to size, the farms of the larger size groups are considerably more important than they are in the distribution of the number of farms, but less important than they are in the distribution of the total farm acreage. This results, of course, from the very low percentage of improved land in the farms of the largest size groups. Three-fourths (75.1 per cent) of the total value of all farm property was reported for farms from 50 to 499 acres in size; 33.9 per cent of the total was reported for farms in the single size group comprising farms of from 175 to 499 acres; and 26.8 per cent of the total was reported for farms of from 100 to 174 acres in size.

The distribution of the value of land alone naturally follows rather closely the distribution of the value of all farm property, since the land in most cases represents a very large percentage of the total value of the farm. In the distribution of the value of the buildings, the smaller size groups show a larger percentage of the total value, since many of the smaller farms are equipped with expensive buildings.

Domestic animals on farms, by size of farm: 1920 and 1910.—The distribution of the total value of live stock on farms in the United States in 1920 and 1910 among farms classified according to size is shown in Tables 4 and 5. More detailed information with regard to the distribution of the different kinds of domestic animals among the farms of the several size groups is given in Tables 8 and 9, which show the number and the value of the different kinds of animals, by size of farm, for 1920 and 1910.

Tables for divisions and states.—In Tables 10, 11, and 13 to 17, inclusive, the data relating to farms classified by size are presented by geographic divisions and states. Table 12 shows, by divisions and states, the average acreage of all land per farm and also the average acreage of improved land per farm for each census from 1850 to 1920.

TABLE 4.—VALUE OF FARM PROPERTY IN THE UNITED STATES, BY SIZE OF FARM: 1920 AND 1910. [Figures for divisions and states in Tables 18 and 15.]

Introduction.—This chapter presents the statistics of farms and farm property (including live stock) collected at the 1920 census, classified according to the tenure under which the farm operators held their land. Comparative figures for 1910 are given for most of the items; and the number of farms classified by tenure is given for the different censuses beginning with 1880, at which time the tenure classification was first made a part of the agricultural inquiry.

Separate figures for white and colored farmers classified according to tenure are given in Chapter IV, entitled "Farm statistics by color and tenure of farmer." The tenure classification also forms an important feature of Chapter V, entitled "Farm statistics by race, nativity, and sex of farmer," and of Chapter VI, on "Farm operators by age, number of years on farm, and farm experience."

That branch of agricultural statistics which relates to the distribution of farms and farm property according to the tenure of the operator is of the utmost importance. The three main classes of farm operators, on the basis of tenure, are owners, managers, and tenants. In many of the tables which follow, a distinction is made between owners who operate their own land only and those who hire additional land, while tenants are subdivided into three groups (five groups in the South) according to the method of paying their rent. The three classes of tenants which are shown separately for the North and the West are share tenants, share-cash tenants, and cash tenants. For the South, in 1920, croppers were separated from the other share tenants; and standing renters were shown separately from cash tenants.

The several tenure classes used in the 1920 census reports have been defined as follows:

Farm owners include (1) farmers operating their own land only and (2) those operating in addition to their own land some land hired from others. The latter are sometimes designated *part owners*, the term *full owners* being then used for those owning all the land they farm.

Farm managers are farmers operating a farm for the owner for wages or a salary.

Farm tenants are farmers who as tenants, renters, or croppers, operate only rented land. They were reported in 1920 in five classes: (1) Share tenants—those who pay a certain share of the products, as one-half, one-third, or one-quarter, for the use of the farm, but furnish their own work animals; (2) croppers—share tenants whose work animals are furnished by their landlords; (3) share-cash tenants—those who pay a share of the products for a part of the land and cash for a part; (4) cash tenants—those who pay a cash rental, as \$7 per acre of crop land or \$500 for the use of the whole farm; (5) standing renters—those who pay a stated amount of farm products for the use of the farm, as 3 bales of cotton or 500 bushels of corn. In some cases the character of the tenancy was not indicated on the schedule; such tenants are shown in the tables as "unspecified."

In censuses prior to 1920 the question of assigning the tenure classification of the farmer was left largely to the enumerator, who was supplied with a set of more or less specific definitions. In 1920 a new method was adopted and in place of requiring any tenure classification by the enumerator, six simple and direct questions relating to tenure were placed on the schedule, and the tenure classification of the farmer was determined in the office on the basis of the replies to these questions. The questions by which the tenure classification was thus determined were as follows:

1. Do you own all of this farm? (Answer Yes or No.)

2. Do you rent from others part but not all of this farm? (Answer Yes or No.)

3. Do you *rent* from others all of this farm? (Answer Yes or No.) (a) If you rent all of this farm, what do you pay as rent?

(b) Does the person from whom you rent furnish all the work animals? (Answer Yes or No.)

4. Do you operate this farm for others as a hired manager? (Answer Yes or No.)

This method proved very satisfactory, the number of farms for which the form of tenancy was not ascertained (tenants—unspecified) being only a little more than half as great as in 1910, when the enumerator was required to determine and report the tenure classification of each farmer.

In 1910, tenants were classified as share, share-cash, cash, and unspecified, the definitions being practically identical with those used in 1920. In 1900, sharecash tenants were included with share tenants, and tenants for whom the form of tenancy was not reported were tabulated with cash tenants. In 1880 and 1890 managers were not reported separately, being included with owners, and only two classes of tenants, cash tenants and share tenants, were recognized. The definitions used for these classes in 1880 and 1890 apparently resulted in including with share tenants those tenants who paid a fixed quantity of products as rent (now designated "standing renters"), while since 1900 this class has been included with cash tenants.

Three different sets of tenure classes, differing in the amount of detail shown, were used in the reports of the 1910 census of agriculture. The one most frequently used showed three classes only: Owners, (121) managers, and tenants. These classes, which were sometimes designated "major tenure groups," represent the fundamental types of farm tenure and for most purposes are quite adequate.

Another classification showed five different kinds of tenure: Owners (full owners), / part owners) managers, share tenants (including share-cash), and cash tenants (including "unspecified"). This was used in the presentation of farm acreage and farm values by geographic divisions. The third and most detailed of the classifications included seven classes, there being four subdivisions of tenants instead of two, namely, share, share-cash, cash, and unspecified. This classification was used in a table giving the number of farms by geographic divisions and states, and also in a table giving farm acreage for the United States as a whole. In the comparative tables for 1920 and 1910 which are presented herewith, the classification is given in as great detail as the figures available for 1910 will permit, while the 1920 data, with the complete tenure classification, are given in separate tables.

Number and acreage of farms, by tenure: 1920 and 1910.-In the United States as a whole, in 1920, 60.9 per cent of all farms were operated by their owners; these farms contained 66.6 per cent of all land in farms and 62.4 per cent of the improved farm land. Tenants constituted 38.1 per cent of the total number of farmers, and operated 27.7 per cent of the total farm acreage and 34.9 per cent of the improved land. Farms operated by managers represented 1.1 per cent of the total number, 5.7 per cent of all farm land, and 2.6 per cent of the improved land. The percentages for tenant farms are somewhat larger in each case than the corresponding percentages in 1910, while those for farms operated by their owners are somewhat smaller, as indicated by the figures in Table 2. The increase in the proportion of farms operated by tenants was most marked, however, in certain states of the Northwest (for the most part states where the percentage was relatively low. even in 1920), while many Eastern states and even some Southern states showed a decrease in the percentage of tenancy. and the house the sector

1 A minus sign (-) denotes decrease. () Share tenants include croppers reported in the Southern states in 1920, and easy tenauts likewise include standing renters.

For the United States as a whole, in 1920, farms operated by owners averaged 162.2 acres in size; by tenants, 107.9 acres; and by managers, 790.8 acres. The average size of tenant farms was thus smaller than that of farms operated either by owners or by managers. There was a larger proportion of improved land in the tenant farms, however; hence there was much less difference between the average acreage of improved land in owned and in rented farms (S0 acres and 71.6 acres, respectively) than in the averages based on the total acreage.

Though in the United States as a whole tenant farms average much smaller in size than other farms, this condition is not characteristic of the entire

É E

country, but is due to the special conditions in the South. In practically all of the cotton-growing states tenant farms are less than half the size of owner-operated farms, while in many of the Northern states and in the Pacific Coast states the average acreage is larger for farms operated by tenants than for those operated by owners.

In all states farms operated by managers average larger in size than those operated by either owners or tenants. This is due to the fact that many extensive ranches, large estates, and large farms owned by institutions are operated by managers, and also to the fact that managers are seldom employed to operate very small farms.

¹ Share tenants include croppers reported in the Southern states in 1920, and cash tenants likewise include standing renters.

Number of farms, by tenure: 1880 to 1920.—Of the total number of farms in the United States in 1920, 2,454,804, or 38.1 per cent, were operated by tenants, as compared with 37 per cent in 1910, 35.3 per cent in 1900, 28.4 per cent in 1890, and 25.6 per cent in 1880. It thus appears that while the percentage of farms operated by tenants is still increasing, the increase during the last decade was not so great as that which took place in any of the earlier decades for which figures are available.

Though for the United States as a whole farm tenancy is still on the increase, there are certain sections in which it seems to have reached or passed its maximum. In all the states of the New England and Middle Atlantic divisions, for example, the 1920 figures show a decrease in the percentage of tenancy, continuing a tendency which has been in evidence since 1900 or earlier. For the South as a whole the percentage of tenancy in 1920 was the same as in 1910, namely, 49.6; and among the 16 Southern states only 6 showed an increased percentage of tenants. The net increase in the percentage of tenancy for the United States as a whole is due, therefore, to the increase in the number of tenant farms in certain states of the West and Northwest. While the correlation is only approximate, it may be stated that in general the areas showing a marked increase in the percentage of farms operated by tenants represent the more recently settled regions of the country or at least those regions where agriculture has been most recently developed.

1 A minus sign (-) denotes decrease. 2 Share tenants include croppers reported in the Southern states in 1920, and cash tenants likewise include standing renters.

Farms of minor tenure groups: 1920 and 1910.—Of the total number of farms operated by owners on January 1, 1920, 85.8 per cent were operated by full owners (those who owned their entire farms), while 14.2 per cent, or about one-seventh, were operated by part owners (those who rented some land in addition to that which they owned). The land in the farms of part owners, however, amounted to more than onefourth of the total, the average size of the farms of the part owners being more than twice that of the farms of the full owners. Between 1910 and 1920 the number of full owners increased slightly, while the number of part owners decreased 5.9 per cent.

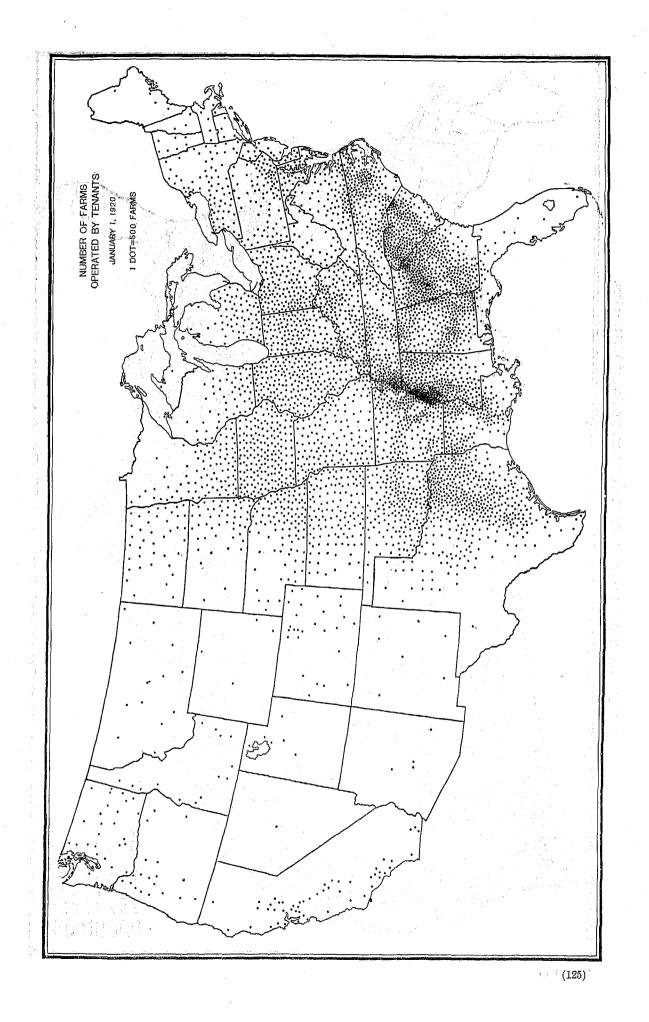

Of the farms operated by tenants under specified forms of tenancy, seven-tenths (70.2 per cent) were operated on a share basis; nearly one-fourth (24.5 per cent) were rented on a cash basis—including those for which the rent was paid in the form of a fixed quantity of products; and the remainder (5.3 per cent) were operated on a share-cash basis. With most of these share-cash tenants the share feature predominated, the principal crops being usually grown on shares, with cash rent for the acreage in pasture, garden, etc.

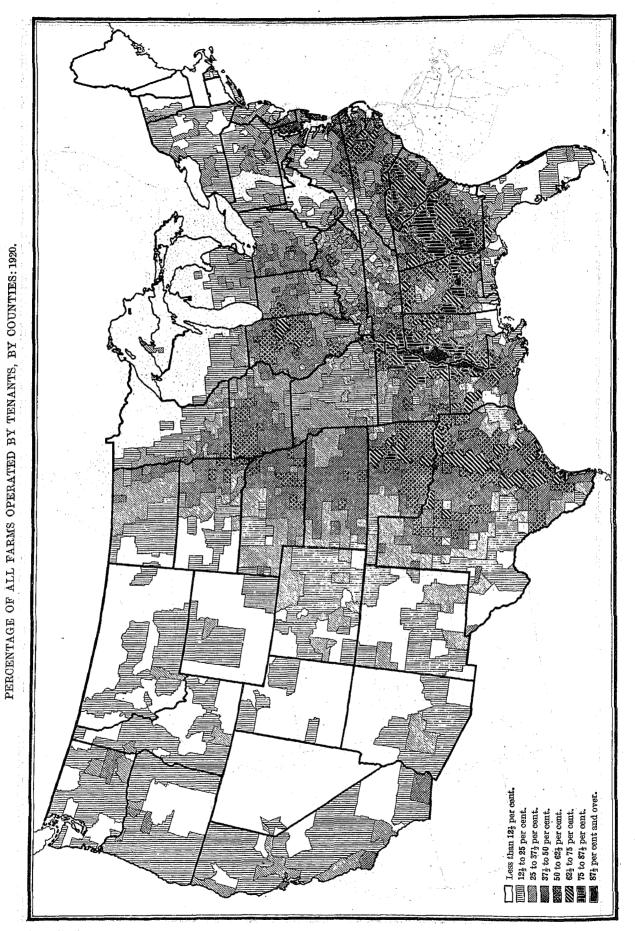

12

In 1910 share tenants represented 62.5 per cent of the whole number of tenants (omitting the "unspecified"); share-cash tenants, 5.7 per cent; and cash tenants, 31.8 per cent. The 1920 figures therefore show a considerable increase in the proportion of share tenants, with a corresponding decrease in the cash tenants.

Farm tenure in the South.—A considerable proportion of the tenants in the South occupy a very different economic position from that usually occupied by tenants in other parts of the country. In the North and the West the tenant farmer is normally working toward buying a farm and his tenancy thus represents merely a stage on the way to ownership. In the South, on the other hand, there are large numbers of tenants who do not look forward to ownership and for whom tenancy is the normal economic situation.

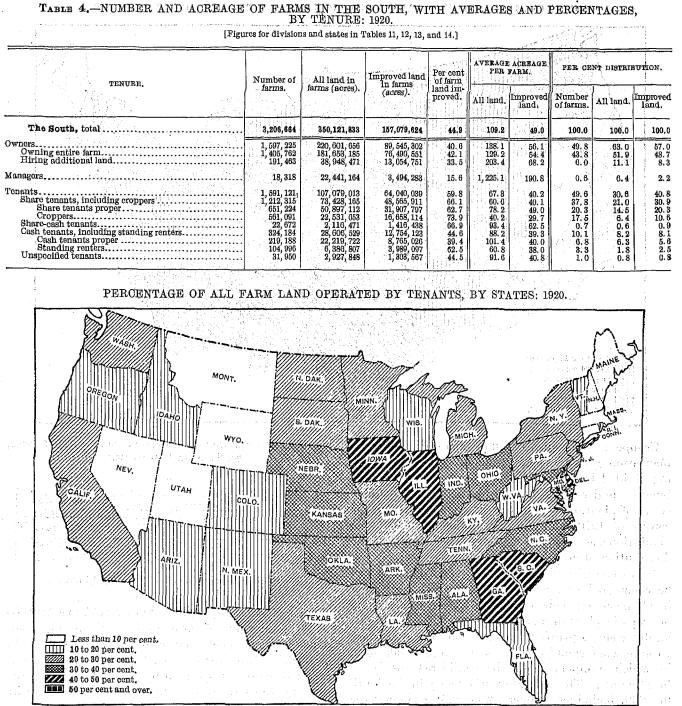

The special tabulation made for the South, showing additional tenure classes for 1920, is significant in this connection. In this tabulation standing renters were separated from cash tenants and croppers were separated from other share tenants.

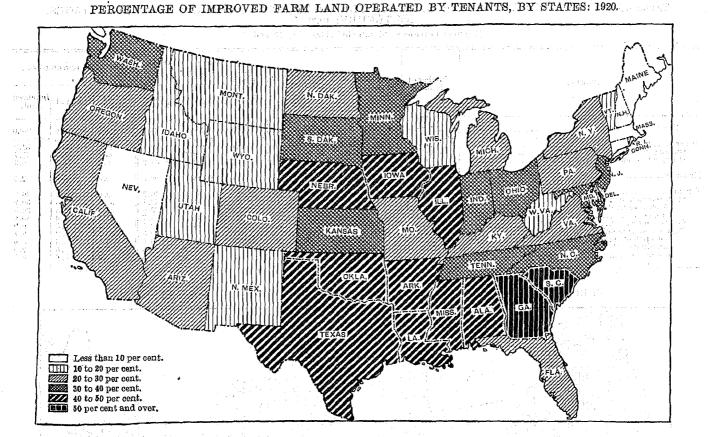

(126)

FARM TENURE.

Standing renters were defined as tenants who paid for the use of the land a fixed quantity of some farm product rather than an amount in cash. These tenants in 1910 were included with the cash tenants. chiefly because the quantity of the product to be given for the use of the land was fixed in advance and did not depend upon the size of the crop. The number of standing renters in the South in 1920 was 104,996, and the number of cash tenants 219,188, the standing renters representing 32.4 per cent of the combined total.

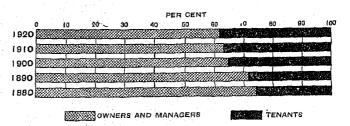

The most important difference between the cropper and the regular share tenant lies in the greater degree of supervision exercised by the landlord in the case of the cropper. As a convenient means of classification, however, croppers were defined as share tenants to whom the landlord furnished the necessary work stock. The number of croppers in the South in 1920 was 561,091, and the number of regular share tenants, 651,224. The croppers thus formed 46.3 per cent, or nearly one-half, of all the share tenants in the South. aduments to real heating the bit

Croppers are frequently found operating under the plantation system of management, the plantation being divided into small tracts which are operated by tenants under very close supervision. A detailed study of plantations was made in connection with the census of 1910, and the distribution of tenants on plantations, as shown by that study, was similar to the distribution of croppers in 1920.

It is sometimes claimed that croppers ought not to be considered as tenants at all, but rather as hired hands receiving their payment in the form of a share of crops in place of a stated wage. While conditions hardly seem to justify this contention, it is interesting to note what would be the result of a reclassification in which croppers should be considered simply as hired hands. The percentage of tenancy in the South in 1920, including croppers, was 49.6; excluding the croppers both from the number of tenants and from the total number of farmers, the percentage would be 38.9. In the state of Georgia, which in 1920 showed the highest percentage of tenancy among all the states in the United States, the percentage would be reduced from 66.6 to 51.3 if the croppers were excluded. Even with the croppers excluded, however, several other Southern states, in addition to Georgia, would still have higher percentages of tenancy than any of the Northern states, among which Nebraska, with 42.9 per cent, and Illinois, with 42.7 per cent, show the highest proportion of tenants.

PER CENT DISTRIBUTION OF FARMS IN THE UNITED STATES, BY TENURE: 1880 TO 1920.

Value of farm property, by tenure: 1920 and 1910 .---Of the total value of farm property (including land, buildings, implements and machinery, and live stock) in 1920, a little over three-fifths (61.1 per cent) was reported for farms operated by owners; slightly more than one-third (34.9 per cent) for farms operated by tenants; and the remainder (4 per cent) for farms operated by hired managers. The distribution of the total value of farm property among the several tenure classes in the different parts of the country follows very closely the distribution of improved land in farms, by reason of the fact that the value of the improved land represents a very large part of the value of all farm property. In 1910 the value of the property reported for farm owners represented 65.1 per cent of the total and that reported for tenants only 30.8 per cent. The 1920 figures given above thus indicate a relative, decrease for owners and an increase for tenants.

Domestic animals on farms, by tenure: 1920 and 1910.—Of the total value of live stock (including poultry and bees) on farms in 1920, as shown in Tables 5 and 6, only 29.3 per cent was reported for farms operated by tenants, though such farms formed 38.1 per cent of the total number of farms and included 34.9 per cent of the improved land in farms. The farms operated by managers, on the other hand, though forming only 1.1 per cent of the total number and including only 2.6 per cent of the improved farm land, reported 4.5 per cent of the total value of live stock on farms. Detailed information with regard to the distribution of domestic animals among the tenure classes is given in Table 9, which shows the number and value of the different kinds of animals, by tenure, for 1920 and 1910.

Tables for divisions and states.—In Tables 10 to 22, inclusive, the data which are summarized in Tables 1 to 9 are presented by divisions and states. Comparative figures for 1920 and 1910 are first presented for each subject, giving the tenure classification with as much detail as the available 1910 figures permit. Comparative figures for the number of farms are also given for the censuses from 1880 to 1920; and the 1920 figures are presented for the complete tenure classification, including the new tenure classes (croppers and standing renters) which were tabulated for the Southern states.
