# CHAPTER V.—FARM STATISTICS BY RACE, NATIVITY, AND SEX OF FARMER

#### WITH PRINCIPAL DATA CLASSIFIED ALSO BY TENURE,

#### INTRODUCTION.

This chapter presents statistics for the number, acreage, and value of farms (value of land and buildings). as collected at the census of 1920, classified according to race, nativity, and sex of farmer. The principal data are also classified according to tenure. The classification of farm operators according to sex has not been made at any previous census; nor have the figures for farm acreage and value been tabulated by nativity of farmer heretofore. Much of the material is therefore of necessity presented for 1920 only. Comparative figures showing the number of farms (or the number of farm operators, which is the same as the number of farms) are given for 1910 under most of the classifications; and figures showing the number of farmers by race are also given for 1900, which is the earliest census year for which any of this material is available.

The classification according to nativity has been made for the white farm operators only, since prac-

#### RACE, NATIVITY, AND TENURE OF FARMERS.

Number of farmers, by race: 1900 to 1920.—Of the 6,448,343 farms in the United States in 1920, 5,498,454, or 85.3 per cent, were operated by white farmers, and 949,889, or 14.7 per cent, by colored farmers, including 925,708 Negroes, 16,680 Indians, 6,892 Japanese, and 609 Chinese. The percentage of farms operated by colored farmers increased from 13.4 per cent in 1900 to 14.5 per cent in 1910, and again to 14.7 per cent in 1920. The increase in the proportion of colored farmers has been mainly in the Southern states, however, where it has resulted largely from the continued breaking up of plantations formerly operated by wage hands into small farms operated by colored tenants.

Table 1.—Number of Farm Operators in the United States, with Per Cent Distribution, by Race, 1900 to 1920.

[Figures for divisions and	i states in	Tables 6	and 15.

1 Less than one-tenth of 1 per cent.

tically all of the colored farmers are of native birth. In the first group of tables, figures are presented for native white farmers, foreign-born white farmers, and colored farmers. This group is followed by tables showing the colored farmers classified according to race and the foreign-born white farmers classified according to country of birth.

The tenure classification appears in this chapter as a subordinate feature, though it is likely to prove a very significant factor in any intensive study of the distribution of farm operators according to race and nativity. Only the three main tenure classes, namely, owners, hired managers, and tenants, are shown in this connection. For more detailed information with regard to farm tenure, the reader is referred to Chapter III, which is devoted primarily to that subject, and to Chapter IV, in which the items are further classified by color of farm operator.

The decrease in the number of farms operated by Indians from 24,251 in 1910 to 16,680 in 1920 is due mainly to a change in the method of enumerating the farming operations on Indian reservations. In 1910 special efforts were made to obtain a schedule for each individual Indian engaged in agriculture, while in 1920 many reservation groups were enumerated as single farms. The figures therefore do not necessarily indicate any decrease in the number of Indians actually engaged in farming.

Practically all (98.9 per cent) of the Negro farmers in 1920 were in the Southern states and the number of Negro farmers outside the South was smaller in 1920 than in 1910. The number of Japanese farmers reported in 1920 was more than two and one-half times as great as the number in 1910, though there was a slight decrease in the number of Chinese farmers. Practically all of the Japanese and Chinese farmers are in the Mountain and Pacific states.

Number of farmers, by color, nativity, and tenure: 1920 and 1910.—Of the 5,498,454 white farm operators in 1920, 581,068, or 9 per cent, were foreign born, as compared with 10.5 per cent in 1910. The decrease in the actual number of foreign-born white farmers amounted to 13.2 per cent, while the number of native white farmers (including those with country of birth not reported) increased 3.1 per cent during the decade, and the number of colored farmers likewise increased 3.1 per cent.

More than 60 per cent of the foreign-born white farmers are in the two North Central divisions, though in most of the states outside the South, foreign-born white farmers form a considerable proportion of all farmers. Between 1910 and 1920 the proportion of foreign-born white farmers decreased in nearly all states except those of the New England and Middle Atlantic divisions. Most of the foreign-

ALL FARM LAND—PER CENT DISTRIBUTION BY RACE AND NATIVITY OF FARMER, BY STATES: 1920.

born white farmers in the Central states have been in this country for a considerable time, and the decrease in their number by death and other causes has not been entirely counterbalanced by new immigration, whereas in several Atlantic Coast states a sufficient number of recent immigrants have started farming during the decade to bring about a net increase in the number of foreign-born white farmers.

TABLE 2.—NUMBER OF FARM OPERATORS IN THE UNITED STATES, WITH PER CENT DISTRIBUTION, BY COLOR, NATIVITY, AND TENURE: 1920 AND 1910.

<sup>&</sup>lt;sup>1</sup> Includes farmers with country of birth not reported, as follows: For 1920, 99,540; for 1910, 7,807.

In the United States as a whole 79.9 per cent of the foreign-born white farmers in 1920 were owners, as compared with 65.6 per cent of the native white farmers—in both cases a slightly lower percentage than in 1910. The higher proportion of owners among foreign-born than among native white farmers is due principally to the fact that the majority of the foreign-born white farmers have been in this country for some length of time, and hence the class includes relatively few young men who are renting land as a step to ownership, whereas a considerable portion of the native white farmers are tenants of this type. In this connection it might be noted that in New England, where in some sections foreign-born farmers are gradually displacing the native white stock, the proportion of owners is higher among the native farmers than among the foreign born.

Acreage and value of farms, by color, nativity, and tenure of farmer: 1920.—Of the total acreage of land in farms in 1920, 83.7 per cent was operated by native white farmers, 11.6 per cent by foreign-born white farmers, and 4.7 per cent by colored farmers. The average size of the farms operated by colored farmers was 47.3 acres, as compared with 191.3 for the foreign-born white farmers and 162.6 for the native white farmers. The difference in these averages is due in part, however, to the fact that most of the colored farmers are in the Southern states, where the average size of all farms is small, while most of the foreign-born white farmers are in states where the average size of farms is rather large.

Table 3 shows the distribution, by color, nativity, and tenure of farmer, of the total farm acreage,

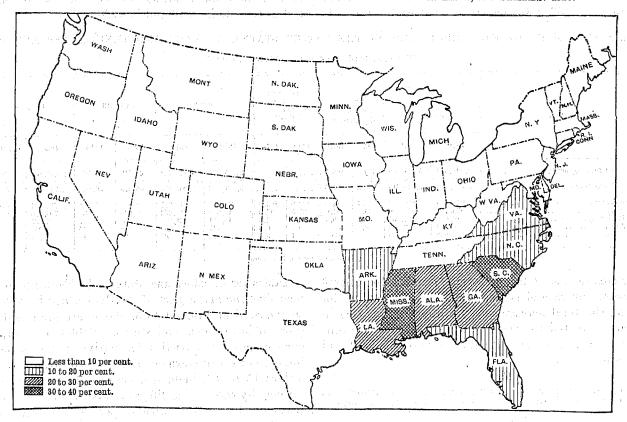

the improved acreage, and the value of land and buildings.

Tables for divisions and states.—In Tables 6 to 17, inclusive, the major part of the data which have been summarized in Tables 1 to 5, above, are presented by geographic divisions and states. Tables 6 to 14, inclusive, present statistics for native white farmers, foreign-born white farmers, and colored farmers, while Tables 15 to 17, inclusive, present data for colored farmers by race. The differences between the various parts of the country with respect to the race and nativity of farm operators are probably greater than the differences with respect to any other classification; hence it is especially important, in connection with this subject, to give careful attention to the geographic distribution of the various items under consideration. In order to expedite the publication of the figures themselves, however, it has been necessary to forego any attempt at a detailed analysis of these tables in the present report.

#### COUNTRY OF BIRTH AND TENURE OF WHITE FARMERS.

White farmers, by country of birth and tenure: 1920 and 1910.—Since the great majority of the present foreign-born white farmers were in this country before the outbreak of the World War, the whole number has been classified in accordance with the boundaries of their native countries as they existed in 1914, and no attempt has been made to adjust the returns on account of later changes in the political subdivisions of European territory.

FOREIGN-BORN WHITE FARMERS IN THE UNITED STATES, BY COUNTRY OF BIRTH: 1920 AND 1910.

The foreign countries which contributed the largest numbers to the total of 581,068 foreign-born white farmers who were in the United States in 1920 were: Germany, with 140,667; Sweden, with 60,461; Norway, with 51,599; Canada, with 48,668; and Russia, Austria, England, and Denmark, in the order named. This order does not correspond with the order in which the various foreign countries have contributed to the total population of the United States, since the immigrants from certain countries, notably Italy, Poland, and Ireland, have gone chiefly into non-agricultural pursuits.

The farmers from Germany constituted practically one-fourth (24.2 per cent) of the total number of foreign-born white farmers in 1920, and those from the Scandinavian countries (Norway, Sweden, and Denmark) nearly another fourth (23.7 per cent), while those from Great Britain and Ireland amounted to less than one-tenth (9.2 per cent) of the total.

The only increases in the number of farmers from any specified country were in those from Poland, Italy, Russia, Hungary, the Netherlands, and France, standing in the order named. The group designated "Other European countries" also shows an increase, and if the figures for four countries shown separately in 1920 but not in 1910 were added, the 1920 total would be more than double that in 1910. Farmers from all other countries for which the 1910 figures are available were fewer in number in 1920 than in 1910, the number from Germany alone showing a decrease of 81,133, or 36.6 per cent.

Acreage and value of farms, by country of birth and tenure of farmer: 1920.—The reports of the census of 1910 showed the number of farmers only, classified by country of birth; hence the comparative figures presented herewith are limited to that item. For 1920, however, the total farm acreage, the acreage of improved land, and the value of land and buildings were tabulated under this classification, by tenure. A summary of the United States totals for each country of birth appears in Table 18, while the same data are given, by tenure, in Tables 19 and 20.

Table 21 gives the per cent distribution by tenure of the number, acreage, and value of the farms operated by foreign-born farmers from each specified country. It must be remembered that both the average age of the farmers and the geographic distribution materially affect the proportion of tenants; hence, in studying the tenure of the farmers from any given country, these factors must be given full consideration.

Tables for divisions and states.—Statistics for foreign-born white farm operators classified according to country of birth are presented, by geographic divisions and states, in Tables 22 to 26, inclusive. Table 23 shows the number of farmers classified by tenure as well as by country of birth, and Table 27 shows for 1920, by geographic divisions only, the acreage and value of farms operated by foreign-born white farmers classified in the same way

TABLE 18.—WHITE FARM OPERATORS IN THE UNITED STATES, BY COUNTRY OF BIRTH, 1920 AND 1910, WITH FARM ACREAGE AND VALUE FOR 1920.

<sup>1</sup> A minus sign (—) denotes decrease. Per cent not shown when more than 1,000.
2 Figures not closely comparable by reason of much greater number of farmers with country of birth not reported in 1920, most of whom were probably born in the United States.
3 In 1910 farmers born in Finland, Rumania, Greece, and Portugal were included with "Other European countries."
4 In 1910 farmers born in Mexico were included with "Other countries."

#### SEX AND TENURE OF FARMERS.

Farms and farm values, by sex and tenure of farmer: 1920.—The classification of farms according to the sex of the operator was made for the first time in 1920. Female farmers operated 4.1 per cent of all farms and 2.7 per cent of all land in farms, while males operated 95.9 per cent of the number of farms, and 97.3 per cent of the total farm acreage. The proportion of women farmers in the different states varied from 1.9 per cent in Nebraska to 7.2 per cent in Rhode Island.

The average size of the farms operated by female farmers was 99.7 acres, as compared with 150.3 acres for the farms operated by males. The smaller size of the farms operated by women is not due to geographic distribution, as the condition holds true in every state.

Tables for divisions and states.—Statistics for farms classified according to the sex and tenure of the farmer are presented, by geographic divisions and states, in Tables 29 to 34, inclusive.

TABLE 28.—NUMBER, ACREAGE, AND VALUE OF FARMS IN THE UNITED STATES, BY SEX AND TENURE OF FARMER, WITH PER CENT DISTRIBUTION BY SEX: 1920.

# CHAPTER VI.—FARM OPERATORS BY AGE, NUMBER OF YEARS ON FARM, AND FARM EXPERIENCE.

#### INTRODUCTION.

This chapter presents statistics relating to the number of farm operators in 1920, classified according to age, occupancy (number of years on farm), and farm experience. The data relating to age and occupancy are further classified by color and tenure, and the tenure status of the farmer forms an important part of the classification according to farm experience. Comparative figures for 1890, 1900, and 1910 are given in the section on age of farmers; and comparative figures for 1910 are given in the section relating to farmers classified according to number of years on farm. The information on farm experience was obtained at the census of 1920 for the first time; hence no comparable data are available.

and comment range will the extension by the experiment

magning of the company of the compan

ayan tan quang kabba saktal sala tan tan dawa

The classification according to tenure and color forms only a subordinate feature of the present report, though the tenure classification is essential to an effective presentation of the data on age, occupancy,

and farm experience. For more detailed information on the subjects of color and tenure, the reader is referred to Chapter III, entitled "Farm Tenure"; Chapter IV, entitled "Farm Statistics by Color and Tenure of Farmer"; and Chapter V, entitled "Farm Statistics by Race, Nativity, and Sex of Farmer."

The term "farmers," as used in this chapter—and, in fact, throughout the reports of the census of agriculture—refers to farm operators, and not to the total farming population of the country, nor to the total number of workers engaged in agriculture. The number of farmers or farm operators given in the various tables for any age group is equal to the number of farms operated by farmers of the designated age, counting one farmer to each farm. Thus the total number of farmers of all ages in 1920 is shown as 6,448,343, which is identical with the number of farms reported for the same date.

#### FARM OPERATORS CLASSIFIED ACCORDING TO AGE.

Farmers by age and color: 1920 and 1910.—The average age of farmers was higher in 1920 than in 1910, a larger proportion of all farmers falling into each of the four age groups comprising farmers 35 years old and over, and a smaller proportion in each of the two age groups under 35 years, in 1920 than in 1910. This change was most marked among the colored farmers. The figures for farm operators classified by age and color are summarized in Table 1.

In addition to the usual factors concerned in changes in the age groups—shifts from farm hand or other occupation to farm operator, changes from farm operator to other pursuits, and losses by death—there was in 1920 an exceptional condition as the result of the World War. Between 1917 and 1920 many young men, farm operators and farm laborers, were drawn from the farms to serve in the military forces or the war industries; furthermore, many older men who had reached the age when they would normally cease active farming continued to operate their farms for a few years longer in order to increase the nation's effective man power. The higher average age of farmers in 1920 would indicate that to a great extent these conditions were still in effect on January 1, 1920.

<sup>1</sup> The average age of all farm operators in the United States in 1920, as computed from the age distribution, was 45.1 years, as compared with 44.5 years in 1910.

Farmers by age, color, and tenure: 1920 and 1910.—In Tables 2 and 3 are presented the figures for farmers classified according to color, tenure, and age, for the United States as a whole. The per cent distribution of farmers by age and tenure is shown on two separate bases. First, the tenure classes are distributed by age, affording an indication of the average age of the farmers in each tenure class; and second, the age groups are distributed by tenure, showing the prevalence of the different forms of tenure among farmers of each specified age group.

In every state except Rhode Island, the proportion of tenants is highest among the youngest farmers, and falls steadily until it is lowest among the oldest farmers. In the distribution of age groups by tenure, for the United States as a whole, the highest proportion of share tenants in any age group in 1920 was among those under 25 years old; the highest proportion for cash tenants, among those 25 to 34 years old; for mortgaged full owners and for part owners, among those 35 to 44 years old; and the highest proportion of full owners free was in the oldest group (65 years and over).

For the United States as a whole the average age of tenants was higher in 1920 than in 1910, the distribution showing a decided shift from the two younger age groups to the middle groups. A similar change, though not so marked, occurred among the owners, the shift being from the groups under 45 to those 45 years old and over.

<sup>&</sup>lt;sup>1</sup> Includes full owners whose mortgage status was not reported.

Farmers in the South by age, color, and tenure: 1920 and 1910.—By reason of the especial importance of the color classification in the South, special tables (Tables 4 and 5) have been made up, showing the totals for the three geographic divisions of the South—the South Atlantic, East South Central, and West South Central.

From these figures, which reflect conditions in the South as a whole, it would appear that the young white farmer in that section, starting as a tenant, moves into the more permanent classes of ownership at a much more rapid rate than the young colored farmer.

The tenant classes in the South form a considerably larger percentage of all farmers than in the United States as a whole, the difference being especially marked in the older age groups.

WHITE FARM TENANTS AND OWNERS IN THE SOUTH, BY AGE: 1920.

Colored Farm Tenants and Owners in the South, by Age: 1920.

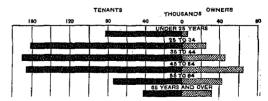

TABLE 4.—FARM OPERATORS IN THE SOUTH, CLASSIFIED ACCORDING TO AGE, COLOR, AND TENURE: 1920 AND 1910.

[Figures for divisions and states in Table 7.]

and a state of the

Owners and tenants by age: 1890 to 1920.—Figures relating to the number of farm operators by age were first published in the reports of the census of 1910. The data on the proprietorship of farms and homes, however, collected in 1890 and 1900 as a part of the census of population, included the number of occupants of farm homes classified by age and tenure. While the figures for "farm homes" are on a slightly different basis from those for "farms," the relative age distribution of the occupants of farm homes in 1890 and 1900 is approximately comparable with the age distribution of farm operators in 1910 and 1920.

The "farm home" figures for 1890 showed a somewhat higher proportion of tenants than did the "farm operator" figures for the same date; therefore, in

using the 1890 figures, it should be remembered that the proportion of tenants shown in these figures is a little higher than the proportion among farm operators, and hence the changes in the age distribution between 1890 and 1900 which were due to the increase of tenancy during that period are not as noticeable as would otherwise be the case.

From 1900 to 1910 there was a noticeable lowering of the average age of all farmers, only 46.3 per cent of those reporting age being 45 years old or older in 1910, as compared with 48.9 per cent in 1900. The change during the decade from 1910 to 1920, however, was in the opposite direction, partly, at least, by reason of the unusual conditions resulting from the World War, which have already been mentioned.

1 Excludes 40.872 occupants of farm homes with form of tenure not reported.
2 Not shown in the reports of the census of 1890, as the number not reporting age was distributed among the several age groups.
2 Included with tenants.

FARM TENANTS AND OWNERS IN THE UNITED STATES, BY AGE: 1920.

Tables for divisions and states.—In Tables 7, 8, and 9, the figures for the number of farmers in 1920 and

1910, classified by age, color, and tenure, are given by divisions and states, together with the per cent distribution, both by tenure and by age. The percentages for all farmers are given for all divisions and states, and for the Southern states and divisions percentages are also shown for white and colored farmers separately. In Table 10, figures are given for owners and tenants, by age, for the several censuses from 1890 to 1920, with the per cent distribution by

TABLE 7.—FARM OPERATORS CLASSIFIED ACCORDING TO AGE, COLOR, AND TENURE, BY DIVISIONS AND STATES: 1920 AND 1910.

## FARM OPERATORS CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM.

In this section, farm operators are classified according to the number of years they had been operating the farm which they occupied on the date of enumeration. The inquiry on the 1920 farm schedule read as follows:

How long have you operated this farm? Years .... Months .....

Answers to this question were obtained on 96.6 per cent of the farm schedules in 1920, as compared with 91.1 per cent for the corresponding inquiry in 1910. In 1910, however, the question read, "How long have you lived on this farm?" and a considerable number of cases where the farmer's total age was reported had to be classified as "not reported."

In tabulating the returns, five groups, or periods of occupancy, were recognized, as follows: Less than 1 year; 1 year (1 year but less than 2 years); 2 to 4 years (2 years but less than 5 years); 5 to 9 years (5 years but less than 10 years); and 10 years and over. The data have been further classified according to the color and tenure of the farm operator.

Accuracy of returns.—These figures are presented with certain reservations. It became evident, as soon as an attempt was made to analyze the results of the 1920 tabulation, that the numbers reported in the first-year group (less than 1 year) were too small and the numbers reported in the second-year group (1 year but less than 2 years) were too large. Each group should represent the farmers who came into possession of their farms during a period of 12 months;

and the second group should be materially smaller than the first, since it is limited to those who stayed on the same farm for a second year.

This relation is properly shown by the 1910 totals for the United States and for most of the geographic divisions and states, though for several states and a considerable number of individual counties, even in 1910, the number of farmers in the second-year group exceeded the number in the first-year group. And while in 1920 a majority of the state totals showed more second-year farmers than first-year, there were 6 states (including the 3 Pacific coast states) and many individual counties where the number of second-year farmers was smaller, as it should be.

Since the only material difference in the enumeration, as between 1920 and 1910, was in the census date, the first thought was to make that change responsible for the inconsistencies between the figures for the two censuses. But the change in the date of enumeration alone would not explain inconsistencies between different counties in the same census. An investigation of conditions in a number of typical counties showed that another factor had to be considered, namely, the period or time of year during which farmers usually move from one farm to another. Three different sets of conditions were found.

First, and most common, in counties where the usual moving time is in February or March, the 1920 figures uniformly show more farmers in the second-

0.000

year group than in the first-year group. In these counties, when the census of 1920 was taken, in January, most of the farmers who had moved within a year had moved early in 1919, and hence had actually been on their farms 10 or 11 months. Very many of these men, influenced perhaps by the fact that they had harvested a crop and had completed a year's farm work, apparently reported a full year in place of the 10 or 11 months which they should have reported, and were thus classified as second-year men, when as a matter of fact they had not quite completed their first year. The 1910 figures for these same counties showed the proper relation between the occupancy groups. The census of 1910 was taken in April, just after the usual moving time in these counties, when most of the farmers who had been on their farms less than a year had moved very recently, so there was no hesitation about reporting correctly the 1 or 2 months of occupancy. For these counties, then, the 1910 figures may be assumed to be correct, and the 1920 figures to be biased by the tendency outlined

Second, in counties where the usual moving time is in January, or approximately the first of the year, the figures for 1920 and 1910 show the same relation as in counties where the moving is done in February and March. The bias in the 1920 figures, in this case, however, results, not from the erroneous reporting of 10 or 11 months as a full year, but from the inevitable uncertainty as to whether the residence was just under 1 year or just over 1 year.

Third, in counties where the usual moving time is in the late summer or in the fall, the 1920 first-year group almost uniformly shows the proper relation to the second-year group. In these counties, when the census was taken, in January, 1920, most of the farmers who had moved within a year had been on their farms only a few months (not long enough, except in scattering instances, to harvest a crop), and evidently reported the time correctly in months—or at least did not call it a full year. In a majority of these counties the 1910 figures also showed the proper relation between the first-year and second-year groups, though in a substantial minority the condition was reversed, and the 1910 second-year group was larger than the first-year group. In April, 1910, even those farmers who had moved in August or September, 1909, would not have harvested a crop, and would have been on their farms only 7 or 8 months. Nevertheless, considerable numbers of these men must have reported a full year of occupancy in 1910, just as the spring movers reported a full year when the census was taken in January, 1920.

The considerations so far discussed affect only the relations between the first-year and the second-year groups. It is evident, however, that the same conditions which, so to speak, pushed men forward from

the first group (where they belonged) into the second group, would operate also to push other men (a smaller number, but still enough to be important) forward from the second group into the third. Thus, in the counties where spring moving is the rule, those men who had been on their farms since the spring of 1918, or a little less than 2 years on January 1, 1920, would have been likely to report their occupancy as 2 years (rather than 1 year and 10 or 11 months), just as those who had moved in 1919 reported 1 year instead of 10 or 11 months. These men would be classified in the third of the occupancy groups (2 to 4 years), and their removal from the second group would partly offset the addition of 10-month men at the other end of the

But even with these additions, the third group formed a smaller percentage of the total in 1920 than in 1910 in the United States as a whole and in all but 10 of the states taken separately. Hence the additions to this group through erroneous reporting could not have been large enough to offset the actual decrease in the relative number of farmers who belonged in the group—this decrease probably resulting from war conditions prevailing during the years 1915. 1916, and 1917.

For certain limited areas, including a number of whole states, where the usual moving time is in the latter part of the year, the 1920 figures would appear to be fairly satisfactory for any purpose. These areas can be identified, roughly, by the relation between the number of farmers in the first-year group and the number in the second-year group.

For states outside these areas, the effect of the failure to report correctly, especially for the first-year group, is particularly serious in relation to the use of the 1920 figures for comparison with the 1910 figures. To some extent this defect can be remedied by combining the first two groups, and starting with a group comprising all farmers who had been on their farms less than 2 years. As indicated above, the tendency to report full years for major fractions of a year affects the other groups to some extent, but this combination will remove the most prominent of the inconsistencies which appear in the figures for any spring-moving area.

Further, entirely apart from comparisons with 1910, the 1920 data may be profitably used for making comparisons between the different tenure classes and also (where the usual moving time falls in the same part of the year) between geographic areas, since the effect of the error in reporting appears to be uniformly distributed where conditions as to moving time are uniform.

Because they serve these purposes fairly well, and also in order that the figures may be available as a basis for any further corrective scheme that may be devised, it has been decided to publish the results of the tabulation of farmers classified according to number of years on farm, complete, as originally planned. The figures are presented "for what they are worth," subject to the shortcomings enumerated above, and should be used with due caution.

Farmers by number of years on farm and by color: 1920 and 1910.—Considering only those farmers for whom reports as to the number of years on farm were secured, it appears that 35.1 per cent of the total

number in 1920 had occupied the farms they were on at the time of the enumeration for 10 years or longer, as compared with 31.1 per cent in 1910. The 1920 percentage for white farmers alone was 37.2, and for colored farmers, 22.4. The data relating to number of years on farm are summarized for the United States, for 1920 and 1910, in Table 11.

Farmers by number of years on farm, and by color and tenure: 1920 and 1910.—Table 12 shows the number of farm operators in the United States classified according to color, tenure, and number of years while Table 13 shows the per cent distribu-

tion according to term of occupancy for all farmers, and for white and colored farmers separately, classified according to tenure. The farmers in each occupancy group are also distributed according to tenure, with separate figures for white and colored.

Farm tenants by number of years on farm and by color: 1920.—The tabulation according to tenure in 1920 was made in somewhat greater detail, especially for the Southern states, than that for 1910. Six tables are presented, therefore, showing for 1920 alone the detailed tenure classification. These include two tables for the United States as a whole (Tables 14 and 16), two for the South (Tables 15 and 17), and two for divisions and states (Tables 19 and 22).

TABLE 14.—FARM TENANTS IN THE UNITED STATES CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM, BY COLOR AND FORM OF TENANCY: 1920.

Tables for divisions and states.—Tables 18 to 22 show in detail the number of farm operators classified according to number of years on farm and also by color and tenure, by divisions and states. In view of the fact that colored farmers are of relatively little importance outside the South, the percentage tables show figures for white and colored farmers separately only for the Southern divisions and states.

TABLE 15.—FARM TENANTS IN THE SOUTH CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM, BY COLOR AND FORM OF TENANCY: 1920.

TABLE 9.—PER CENT DISTRIBUTION OF FARM OPERATORS IN EACH AGE GROUP, BY TENURE, BY DIVISIONS AND STATES: 1920 AND 1910—Continued.

[Data for white and colored farmers are given for the United States and for the Southern divisions and states only. All percentages based on number of farm operators reporting age, as shown in Table 7. Total number of farmers in each age group equals 100 per cent.]

TABLE 9.—PER CENT DISTRIBUTION OF FARM OPERATORS IN EACH AGE GROUP, BY TENURE, BY DIVISIONS AND STATES: 1920 AND 1910—Continued.

[Data for white and colored farmers are given for the United States and for the Southern divisions and states only. All percentages based on number of farm operators reporting age, as shown in Table 7. Total number of farmers in each age group equals 100 per cent.]

<sup>&</sup>lt;sup>1</sup> Includes full owners whose mortgage status was not reported.

<sup>&</sup>lt;sup>2</sup> Less than one-tenth of 1 per cent.

TABLE 9.—PER CENT DISTRIBUTION OF FARM OPERATORS IN EACH AGE GROUP, BY TENURE, BY DIVISIONS AND STATES: 1920 AND 1910—Continued.

Data for white and colored farmers are given for the United States and for the Southern divisions and states only. All percentages based on number of farm operators reporting age, as shown in Table 7. Total number of farmers in each age group equals 100 per cent.

	reportin	ig age, as	shown i			l number	r of farme	ers in eac	h age gro	up equal	s 100 per	cent.]				perators

## FARM OPERATORS CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM.

In this section, farm operators are classified according to the number of years they had been operating the farm which they occupied on the date of enumeration. The inquiry on the 1920 farm schedule read as follows:

How long have you operated this farm? Years .... Months .....

Answers to this question were obtained on 96.6 per cent of the farm schedules in 1920, as compared with 91.1 per cent for the corresponding inquiry in 1910. In 1910, however, the question read, "How long have you lived on this farm?" and a considerable number of cases where the farmer's total age was reported had to be classified as "not reported."

In tabulating the returns, five groups, or periods of occupancy, were recognized, as follows: Less than 1 year; 1 year (1 year but less than 2 years); 2 to 4 years (2 years but less than 5 years); 5 to 9 years (5 years but less than 10 years); and 10 years and over. The data have been further classified according to the color and tenure of the farm operator.

Accuracy of returns.—These figures are presented with certain reservations. It became evident, as soon as an attempt was made to analyze the results of the 1920 tabulation, that the numbers reported in the first-year group (less than 1 year) were too small and the numbers reported in the second-year group (1 year but less than 2 years) were too large. Each group should represent the farmers who came into possession of their farms during a period of 12 months;

and the second group should be materially smaller than the first, since it is limited to those who stayed on the same farm for a second year.

This relation is properly shown by the 1910 totals for the United States and for most of the geographic divisions and states, though for several states and a considerable number of individual counties, even in 1910, the number of farmers in the second-year group exceeded the number in the first-year group. And while in 1920 a majority of the state totals showed more second-year farmers than first-year, there were 6 states (including the 3 Pacific coast states) and many individual counties where the number of second-year farmers was smaller, as it should be.

Since the only material difference in the enumeration, as between 1920 and 1910, was in the census date, the first thought was to make that change responsible for the inconsistencies between the figures for the two censuses. But the change in the date of enumeration alone would not explain inconsistencies between different counties in the same census. An investigation of conditions in a number of typical counties showed that another factor had to be considered, namely, the period or time of year during which farmers usually move from one farm to another. Three different sets of conditions were found.

First, and most common, in counties where the usual moving time is in February or March, the 1920 figures uniformly show more farmers in the second-

0.000

year group than in the first-year group. In these counties, when the census of 1920 was taken, in January, most of the farmers who had moved within a year had moved early in 1919, and hence had actually been on their farms 10 or 11 months. Very many of these men, influenced perhaps by the fact that they had harvested a crop and had completed a year's farm work, apparently reported a full year in place of the 10 or 11 months which they should have reported, and were thus classified as second-year men, when as a matter of fact they had not quite completed their first year. The 1910 figures for these same counties showed the proper relation between the occupancy groups. The census of 1910 was taken in April, just after the usual moving time in these counties, when most of the farmers who had been on their farms less than a year had moved very recently, so there was no hesitation about reporting correctly the 1 or 2 months of occupancy. For these counties, then, the 1910 figures may be assumed to be correct, and the 1920 figures to be biased by the tendency outlined

Second, in counties where the usual moving time is in January, or approximately the first of the year, the figures for 1920 and 1910 show the same relation as in counties where the moving is done in February and March. The bias in the 1920 figures, in this case, however, results, not from the erroneous reporting of 10 or 11 months as a full year, but from the inevitable uncertainty as to whether the residence was just under 1 year or just over 1 year.

Third, in counties where the usual moving time is in the late summer or in the fall, the 1920 first-year group almost uniformly shows the proper relation to the second-year group. In these counties, when the census was taken, in January, 1920, most of the farmers who had moved within a year had been on their farms only a few months (not long enough, except in scattering instances, to harvest a crop), and evidently reported the time correctly in months—or at least did not call it a full year. In a majority of these counties the 1910 figures also showed the proper relation between the first-year and second-year groups, though in a substantial minority the condition was reversed, and the 1910 second-year group was larger than the first-year group. In April, 1910, even those farmers who had moved in August or September, 1909, would not have harvested a crop, and would have been on their farms only 7 or 8 months. Nevertheless, considerable numbers of these men must have reported a full year of occupancy in 1910, just as the spring movers reported a full year when the census was taken in January, 1920.

The considerations so far discussed affect only the relations between the first-year and the second-year groups. It is evident, however, that the same conditions which, so to speak, pushed men forward from

the first group (where they belonged) into the second group, would operate also to push other men (a smaller number, but still enough to be important) forward from the second group into the third. Thus, in the counties where spring moving is the rule, those men who had been on their farms since the spring of 1918, or a little less than 2 years on January 1, 1920, would have been likely to report their occupancy as 2 years (rather than 1 year and 10 or 11 months), just as those who had moved in 1919 reported 1 year instead of 10 or 11 months. These men would be classified in the third of the occupancy groups (2 to 4 years), and their removal from the second group would partly offset the addition of 10-month men at the other end of the

But even with these additions, the third group formed a smaller percentage of the total in 1920 than in 1910 in the United States as a whole and in all but 10 of the states taken separately. Hence the additions to this group through erroneous reporting could not have been large enough to offset the actual decrease in the relative number of farmers who belonged in the group—this decrease probably resulting from war conditions prevailing during the years 1915. 1916, and 1917.

For certain limited areas, including a number of whole states, where the usual moving time is in the latter part of the year, the 1920 figures would appear to be fairly satisfactory for any purpose. These areas can be identified, roughly, by the relation between the number of farmers in the first-year group and the number in the second-year group.

For states outside these areas, the effect of the failure to report correctly, especially for the first-year group, is particularly serious in relation to the use of the 1920 figures for comparison with the 1910 figures. To some extent this defect can be remedied by combining the first two groups, and starting with a group comprising all farmers who had been on their farms less than 2 years. As indicated above, the tendency to report full years for major fractions of a year affects the other groups to some extent, but this combination will remove the most prominent of the inconsistencies which appear in the figures for any spring-moving area.

Further, entirely apart from comparisons with 1910, the 1920 data may be profitably used for making comparisons between the different tenure classes and also (where the usual moving time falls in the same part of the year) between geographic areas, since the effect of the error in reporting appears to be uniformly distributed where conditions as to moving time are uniform.

Because they serve these purposes fairly well, and also in order that the figures may be available as a basis for any further corrective scheme that may be devised, it has been decided to publish the results of the tabulation of farmers classified according to number of years on farm, complete, as originally planned. The figures are presented "for what they are worth," subject to the shortcomings enumerated above, and should be used with due caution.

Farmers by number of years on farm and by color: 1920 and 1910.—Considering only those farmers for whom reports as to the number of years on farm were secured, it appears that 35.1 per cent of the total

number in 1920 had occupied the farms they were on at the time of the enumeration for 10 years or longer, as compared with 31.1 per cent in 1910. The 1920 percentage for white farmers alone was 37.2, and for colored farmers, 22.4. The data relating to number of years on farm are summarized for the United States, for 1920 and 1910, in Table 11.

Farmers by number of years on farm, and by color and tenure: 1920 and 1910.—Table 12 shows the number of farm operators in the United States classified according to color, tenure, and number of years while Table 13 shows the per cent distribu-

tion according to term of occupancy for all farmers, and for white and colored farmers separately, classified according to tenure. The farmers in each occupancy group are also distributed according to tenure, with separate figures for white and colored.

Farm tenants by number of years on farm and by color: 1920.—The tabulation according to tenure in 1920 was made in somewhat greater detail, especially for the Southern states, than that for 1910. Six tables are presented, therefore, showing for 1920 alone the detailed tenure classification. These include two tables for the United States as a whole (Tables 14 and 16), two for the South (Tables 15 and 17), and two for divisions and states (Tables 19 and 22).

TABLE 14.—FARM TENANTS IN THE UNITED STATES CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM, BY COLOR AND FORM OF TENANCY: 1920.

Tables for divisions and states.—Tables 18 to 22 show in detail the number of farm operators classified according to number of years on farm and also by color and tenure, by divisions and states. In view of the fact that colored farmers are of relatively little importance outside the South, the percentage tables show figures for white and colored farmers separately only for the Southern divisions and states.

TABLE 15.—FARM TENANTS IN THE SOUTH CLASSIFIED ACCORDING TO NUMBER OF YEARS ON FARM, BY COLOR AND FORM OF TENANCY: 1920.

## FARM OPERATORS CLASSIFIED ACCORDING TO FARM EXPERIENCE.

The information with regard to the length and character of the farm experience of farm operators, obtained at the census of 1920 for the first time, was intended to show, first, what proportion of all farmers climb the so-called agricultural ladder, from wage hand to tenant and from tenant to owner; second, the average length of time spent in each of the preliminary stages; and third, the relation between the age of the farmers and their status with regard to farm experience.

The data on farm experience were obtained by means of the following inquiries on the farm schedule:

Figures were tabulated from those schedules where at least the age of the farmer and the number of years of experience in his present (1920) tenure were given. Both age and some farm experience were reported for 89.9 per cent of the owners and 89.8 per cent of the tenants. In the remainder of this section the discussion will be limited to the farmers reporting these items.

For both owners and tenants the reports were classified according to the kinds of farm experience reported,

and further, according to the number of years of experience in the present form of tenure.

The following classes were recognized:

Owners reporting experience as-

- 1. Owner, tenant, and wage earner.
- 2. Owner and tenant. ·
- 3. Owner and wage earner.
- 4. Owner only.

Tenants reporting experience as-

- 1. Tenant, wage earner, and owner.
- 2. Tenant and wage earner.
- 3. Tenant and owner.
- 4. Tenant only.

The farm owners in each of the four groups designated above were further classified, on the basis of the number of years they had been owners, into 10 five-year groups, and the tenants in the same way, on the basis of the number of years they had been tenants. The average age of the farmers and the average number of years of each kind of experience were tabulated for each of the 80 resulting groups.

Farm owners and tenants, by variety of farm experience.—One-fifth of the owners reported experience as owner, tenant, and wage earner, and nearly one-half of the tenants reported previous experience as wage

earner. These two groups can safely be regarded as having made complete reports. It is apparent from a study of the tabulated results, however, that in many cases where no experience as wage earner was reported, the farmers had actually had such experience, but failed to report it on the schedule. It is believed, also, that there was a similar failure to report, though less in extent, on the part of many farmers who had had experience as farm tenant as well as farm owner. In spite of this qualification, however, the classification of farmers according to the variety of farm experience which they report is significant, since the number of farmers reporting earlier experience in any form of tenure other than the present one may be taken without hesitation as a minimum and used as such. It is important to know, for example, that out of each 100 farm owners in the United States, at least 44 have previously operated a farm as a tenant, and at least 35 have worked on a farm for wages.

Average age of farm owners and tenants, and time under present tenure.—The average age of farm owners in 1920 was 48.8 years, while the average age of tenants was 39.1 years. The owners, on the average, had been farming as owners 16.2 years, or since the age of 32.6 years, while the tenants had been renting 11.1 years, or since the age of 28 years. Less than one-half of

the tenants (46.2 per cent) had been renting ten years or more, while nearly two-thirds (63.9 per cent) of the owners had owned farms ten years or more.

For both owners and tenants the number who had been farming less than 5 years under their present form of tenure was greater than the number in any other five-year group. This is to be expected. If a uniform number of men began farming each year, then the number who started in any given past year would at the present time be equal to the number who started minus those who had since died or changed to some other occupation. Hence, the present number of owners who started as owners in any given past year would be less than the present number of those who started in any subsequent year. The rapid fall in the number of tenants above the first group of five years of experience as tenants, as compared with the slower fall in the number of owners in the corresponding groups, would indicate that while more men may enter the ranks of the tenants each year than become owners, they tend to leave that class in a few years, while the owners remain.

Age and farm experience of owners, by variety of experience.—Table 26 presents a complete summary of the United States totals obtained from the farm-experience tabulation, including the average age and the average number of years spent in each kind of farm experience, for farm owners classified according to number of years of ownership.

A large proportion of the owners were reported as becoming owners without previous farm experience. or with previous farm experience of only one kind. If the average age at beginning farm experience be computed for the several classes, by subtracting the average total farm experience from the average age, as given in Table 26, it appears that the farmers who reported experience as owner only were 30.8 years old, on the average, when they began farm work, as compared with 22.2 years for those who reported previous experience both as wage earner and as tenant. While those men who actually became farm owners directly, without previous experience in farm work, would doubtless show a higher average age at beginning than those who began as farm hands working for wages, the difference would hardly be so great (nor the number of cases so large) as the figures in the table would indicate. On the other hand, if a part of the owners who had actually had previous experience as wage hand or tenant, or both, failed to report such previous experience, the higher apparent age at beginning would be explained. It seems probable, as already stated, that this is what took place. And while the average ages at beginning work, as computed in the same way for farm owners reporting only one form of previous experience-25.1 for those reporting owner and tenant and 24.8 for those reporting owner and wage earner-are not by any means as high as for those reporting experience as owner only, it is probable that there was some failure to report experience of another kind, even here. When practicable, therefore, it will be well to limit the use of the averages in Table 26 to those relating to farm owners reporting experience of all three kinds, since there can be little question as to the completeness of their reports.

A word of caution must be added with regard to the use of this table and other tables presenting data classified according to number of years as owner or tenant as a basis for what might be termed "historical" conclusions. It might appear, for example, that significant deductions could be made from the figures in Table 26 with regard to changes from decade to decade in the average age at which men began to work on farms for wages. This average age, obtained as above indicated, for farmers reporting experience of all three kinds, is 23.3 years for owners of less than 5 years' standing, as against 17.1 years for those who have been owners 45 years and over.

It seems probable that the average age of beginning farm work for wages is higher than it was 40 years ago, especially in view of the greater length of time which boys spend in school; but the difference in the computed average ages referred to can not be assumed

to represent this increase. In fact, a careful study of the situation makes it clear that no conclusions of such historical nature can be drawn from the results of a single investigation, however reasonable the conclusions may seem.

In this case, the fallacy lies in failing to take account of the effects of mortality. An investigation of the individual returns for the "1 to 4 years" group reveals a number of cases where farmers were 25. 30, 35, and even 40 years old when they began their farm experience. These cases, of course, contribute materially to the relatively high average age at beginning farm experience for this group. The "45 years and over" group doubtless had about the same proportion of such cases in the early stages of its owner-experience, but most of these men, by reason of their greater age, have died in the intervening 40 years or more, leaving only those who started out as very young men; hence the average age at beginning is low for the present group, largely by reason of the mortality among those members of the original group whose farm experience began at an older age.

Again, the group reporting 45 years of ownership and over shows a much lower average time spent as tenant than the group reporting less than 5 years of ownership. It seems probable that there has been some increase in the average time a man must spend as a tenant before he can acquire ownership of a farm, since the price of farm land, even if computed in equivalent labor or commodity units rather than in dollars, is decidedly higher than it was 40 years ago. But so far as concerns the difference in the average time shown for the several groups in the tables, that is due in part to the same cause which affects the average age at beginning farm work and in part to the way in which the classification is made. Of all the men who started in ownership at the same time as the survivors who make up the present "45 years and over" group, those who had had a long prior experience as tenant are for the most part dead, by reason of their greater age; and among men of similar age, or of similar date of beginning farm work, those who spent a long time as tenant have not yet had time to complete 45 years as owner, and appear in a lower group in the classification on this basis. For these two reasons, then, the men who would bring up the average time as tenant for the "45 years and over" group are not in the group; either they were so old when they started that they have now passed away, or they have not yet had time (after their long tenant-experience) to attain the required 45 years of owner-experience. The "1 to 4 years group," on the other hand, still retains practically its orginal make-up, including many men of extended tenant-experience who will die long before the 5 years which now forms the maximum limit of ownership in this group has become 45 years; nor will any new recruits be added to take their places. It is the inclusion of these older men, then, which is largely responsible for the higher average number of years of tenant-experience among those who have been farm owners less than 5 years.

<sup>&</sup>lt;sup>1</sup> Number of years as owner, no other farm experience being reported.

Age and farms experience of tenants, by variety of experience.—Table 27 presents a summary of the data obtained from the farm-experience tabulation, including the average age and the average number of years spent in each kind of farm experience, for farm tenants classified according to number of years of tenancy.

Nearly one-half the total number of tenants appear in the group reporting experience as tenant only. While it is probable that the great majority in this group actually had no previous experience as wage hand, some allowance must be made, as in the case of the corresponding group of owners, for failure to report previous experience of another kind. Hence, for many purposes, it will be found desirable to use only the figures shown in Table 27 for tenants reporting experience as tenant and wage earner. The number of men now operating farms as tenants, but who have previously been farm owners, is considerable, representing 11.1 per cent of the total number of tenants; but since this combination of experience is hardly a normal one, the groups into which it enters are of less significance than the others.

TABLE 27.—AVERAGE AGE AND FARM EXPERIENCE OF TENANTS IN THE UNITED STATES, CLASSIFIED ACCORDING TO NUMBER OF YEARS AS TENANT: 1920.

[Tenants who did not report both age and number of years as tenant are omitted from this table.]

<sup>1</sup> Number of years as tenant, no other farm experience being reported.

Tables for divisions and states.—Table 28 shows, by divisions and states, the number of farm owners and tenants, classified according to variety of farm experience and number of years under present form of tenure. Table 29 shows, by divisions and states, the number and the average age of owners and tenants, classified according to the length of time they had been owners or tenants, respectively, in 1920. For the

owners reporting all three classes of farm experience, and for the tenants who reported experience both as wage earner and as tenant, the average age and the number of years of each type of farm experience are also shown with separate figures for each of the groups based on the number of years under present (1920) tenure.

TABLE 28.—FARM OWNERS AND TENANTS CLASSIFIED ACCORDING TO VARIETY OF FARM EXPERIENCE, BY DIVISIONS AND STATES: 1920.
