#### CHAPTER II.—SIZE OF FARMS

Introduction.—This chapter presents statistics by groups based upon the size of farms, for the number of farms, farm acreage, specified classes of land according to use, and value of farm property. Comparative data for the number of farms, by size, are given for the United States as a whole and for the geographic divisions and States beginning with the census of 1880. Similar data are given for farm acreage and for the value of specified classes of farm property for the United States from 1900 to 1930; and by geographic divisions and States for 1930, 1925, and 1920. Comparative figures for land classified according to use are available and presented only for "Crop land harvested in 1924" as obtained in the census year 1925; the "use of land" classification in its present form was first made in that year. The size grouping for each of the census years from 1880 to 1930 was based on the total number of acres in the individual farms. In the censuses of 1860 and 1870, a size classification was made based upon the area of improved land rather than upon total farm acreage, so that comparative data are not available for census years prior to 1880.

The size groups used in the different census years have varied from 7 to 12 in number. Partly because of this varying number of groups, and partly to simplify the statistics, combinations of several of the size groups for some of the years have been made in presenting the data in the historical series and also in showing some of the current data for States. There were 12 size groups used for the first time in 1930, as the group "5,000 acres and over," first used in 1920 and again in 1925, was subdivided into 2 groups, namely—"5,000 to 9,999 acres" and "10,000 acres and over." This change gives a more adequate idea of the size of large farms.

The size classification, especially that used beginning with 1900, takes into account the fact that in large sections of the country the boundaries of many farms correspond more or less closely to the Government surveys of public lands. Government land has for the most part been disposed of in quarter sections of 160 acres or approximately that amount; and where these have been broken up, they have commonly been divided into "quarter-quarters" or 40-acre tracts. A large number of farms, therefore, in the greater part of the country contain either 160 acres or some other multiple of 40 acres.

One very important classification by size, namely, the number of farms of various sizes in the different tenure classes, is not presented as a part of this chapter but is given in Chapter III of this volume, "Statistics by Color and Tenure of Farm Operator."

Number and acreage of farms, by size.—Of the 6,288,648 farms in the United States enumerated as

of April 1, 1930, about 2 out of every 3 were between 20 and 174 acres in size, 1 farm in 7 contained less than 20 acres, and about 1 out of 5 contained 175 acres or more. Only 0.7 per cent of all farms were "Under 3 acres" in size and 1.3 per cent contained 1,000 acres or more.

An entirely different distribution of the farm acreage prevailed, as the two-thirds of all farms which were from 20 to 174 acres in size had approximately onethird of the total farm land area; the one-seventh representing farms "Under 20 acres" had only 1 per cent of the farm acreage; while the one-fifth representing farms of 175 acres or more had 66 per cent of the total farm land. Farms "Under 3 acres" had but 0.006 per cent of the farm area, while those having 1,000 acres or more had 28 per cent of the total farm area. A still more striking comparison is shown for the group "5,000 acres and over" which contained 0.1 per cent of the farms and 15.1 per cent of the farm acreage. In making an extensive study of farms by size, State figures are more significant than those for the United States, because, in some States, most farms fall in the smaller size groups, while in other States a much greater proportion falls in the larger size groups.

The number of farms enumerated in 1930 was 82,992 less than the number reported in 1925, and 159,695 less than in 1920. The net loss in 1930 compared with 1925 was due to a decrease in farms ranging from 3 to 174 acres, which was only partly offset by gains in farms "Under 3 acres" and those 175 acres and over. The still greater net loss in number of farms when comparing 1930 with 1920 was due to numerical losses in the groups 20 to 499 acres, counteracted partly by gains in farms "Under 20 acres" and those 500 acres and over. When considering the distribution of the number of farms, the group "5,000 acres and over" was the only one to show a gain from 1920 through 1925 to 1930, whereas the farms ranging from 50 to 174 acres showed a consistent decrease for the same period.

For the decade 1920 to 1930, the proportion of all farms "Under 3 acres" in size increased in all States with the exception of Kentucky. In the next larger group "3 to 9 acres," the proportion decreased in 11 States, as follows—Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, Pennsylvania, Ohio, Wisconsin, Maryland, and Nevada, whereas the remaining States showed proportional increases. The condition in the group "10 to 19 acres" was very similar with Virginia, South Carolina, and Kentucky being added to those States showing decreases, and Nevada to those States showing increases. From the foregoing it appears that there has been a decided

tendency for small farms of less than 20 acres to increase, when shown as a percentage of all farms, in practically all States in the South and West and in the more westerly portion of the North.

The proportion of all farms in the size group "20 to 49 acres" decreased in 30 States during the same decade. In the group "50 to 99 acres," 28 States showed proportionate decreases in the number of farms,

TABLE 1.—NUMBER AND ACREAGE OF FARMS, 1930, 1925, AND 1920; AND SPECIFIED CLASSES OF LAND ACCORDING TO USE IN 1929 AND 1924; IN THE UNITED STATES; WITH PER CENT DISTRIBUTION, BY SIZE OF FARM

<sup>1</sup> A minus sign (-) denotes decrease.

2 Less than one-tenth of 1 per cent.

For the size group "100 to 174 acres" the proportion of all farms decreased in 34 States during the period 1920 to 1930. The decrease in this size group was greater than for any other single group. The decline was common to all States west of the Mississippi River, and to 13 States east of that river, 8 of which were in the South. The proportional increases in this size group were confined to New Hampshire, Massachusetts, Connecticut, New York, Pennsylvania, Ohio, Indiana, Michigan, Wisconsin, Maryland, South Carolina, Georgia, and Kentucky.

In the group "175 to 259 acres," one-half of the States showed proportional increases. These States as compared with the preceding group were mainly in the North, with the addition of Oklahoma, Texas, and Wyoming. The group "260 to 499 acres" showed a very similar distribution. In the group "500 to 999 acres" the number of States showing proportional increases was extended to 24, most of the gain being in the Mountain division, partly offset by scattered losses, while in the group "1,000 acres and over" 16 States showed increases.

Table 2 is presented to show, historically for the United States, as a whole, the number of farms with their distribution by size. The figures in the size group "Under 3 acres" have certain limitations which are discussed in the succeeding paragraphs.

Farms under 3 acres in size.—It is evident from the figures in Table 2 that farms of less than 3 acres have never been numerous, ranging from a high of 0.7 per

cent of all farms in both 1900 and 1930 to a low of 0.1 per cent in 1880. The corresponding percentage (Table 1) was 0.2 for 1925 and 0.3 for 1920. These figures would seem to indicate that there was an enormous relative increase in farms of this size since as recent a date as 1925, and that a similar increase had occurred between 1880 and 1900, which was followed by a considerable decrease in the period 1900 to 1925.

Part of the changes in numbers of farms of this size was no doubt due to changes made from census to census in the definition of a farm; a part was probably due to changes in the unit prices for agricultural products for one year as compared with another, since a given tract of land with a fixed quantity of products in one year might be classified as a farm which would not be so classified in another year when prices of products were lower.

In 1880 the number of farms under 3 acres in size was only 4,352, farms of this size being limited by definition to those from which at least \$500 worth of products had been sold during the year. This size group was not shown in 1890, but in 1900 there were reported 41,385 farms of less than 3 acres. In 1900, the requirements with regard to the value of products of tracts of less than 3 acres had been removed, and all such tracts were reported as farms, provided the operation or management required the constant services of at least one person. The tabulation of these places, classed according to the value of products (not fed to

livestock), shows only 7,853 out of 41,385 with products valued at \$500 or more.

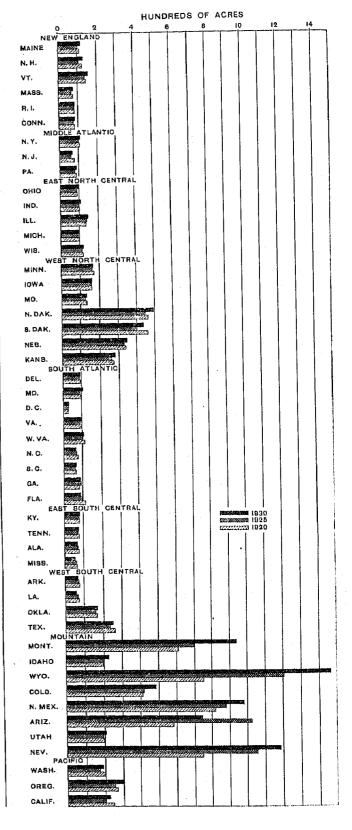

In 1910 the number of farms of less than 3 acres was 18,033. The instructions in 1910 specified that a farm schedule should be prepared for "any tract containing less than 3 acres which either produced at least \$250 worth of farm products in the year 1909 or required for its agricultural operations the continuous services of at least one person." This definition was similar to that used in 1900 with the alternative that the value of farm products amount to at least \$250. The number of farms of less than 3 acres in 1900, tabulated as having products (not fed to livestock) valued at \$250 or over was 12,328. This number may be considered fairly comparable with the number shown for 1910.

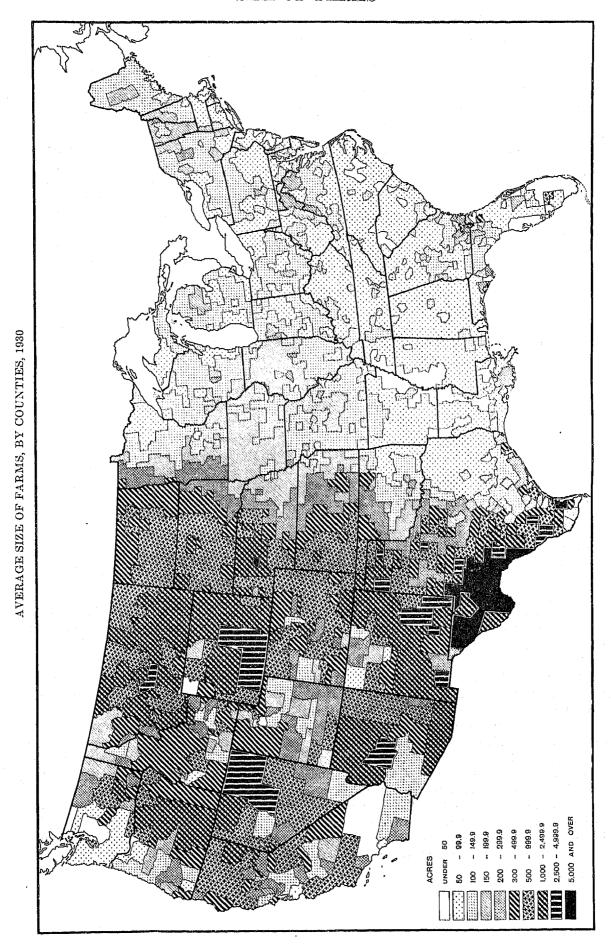

The instructions used in 1920 were practically identical with those used in 1910. At the prices prevailing for farm products in 1919, however, the actual quantities required to make up the value of \$250 would be decidedly less than in 1909, and this change in the value of farm products per unit may be chiefly responsible for the larger number of farms in the group "Under 3 acres" in 1920.

In the instructions to enumerators covering the definition of a farm in 1930 and 1925, no reference was made to the constant services of one person. Therefore, tracts of land of less than 3 acres were to be reported as farms provided the value of products in 1929 or 1924, respectively, amounted to \$250 or more. The omission of the alternative qualification regarding continuous services of at least one person may have been responsible for a part of the decrease shown for the period 1920 to 1925.

In States where free public range is available, some ranchers do not own or lease any land. For office convenience the farms of such operators in 1930 and 1925 were given a nominal acreage of "one", also a nominal value of \$5 in 1930. Therefore, in interpreting the figures for farms of this size in such areas, this limitation should be borne in mind. It should also be pointed out that in 1930 a different method was used in enumerating the farming operations on Indian reservations than was used in 1925 or 1920. Thus in 1930, a special effort was made to obtain a general farm schedule for each Indian engaged in agriculture, while in 1925 and 1920 many reservation groups were enumerated as single farms. This would partly explain the increase in the size group, "Under 3 acres," for the period mentioned, for Arizona, New Mexico, and a few other States.

AVERAGE SIZE OF FARMS, BY STATES: 1930, 1925, AND 1920

Uses of land, by size of farm.—The acreage from which crops were harvested in 1929 and 1924 is shown for the United States in Table 1. This acreage, designated "Crop land harvested," is shown according to the total acreage in individual farms. A similar distribution is also presented in Table 1, for the year 1929 only, of plowable pasture and of pasture land other than plowable or woodland pasture. In the period under discussion, the total crop land harvested showed a 4.3 per cent increase which was almost entirely due to increases for the farms in the larger size groups. Thus farms of 260 acres or more, while forming a nearly constant proportion of all farms, gained in relative importance both from the standpoint of total farm acreage and in crop land harvested. The percentages for farms of this size in 1930 and 1925 were, respectively: For the number of farms, 11 and 10.2; for the total farm acreage, 54.9 and 51.2; while the percentages for crop land harvested in 1929 and 1924 were 39.2 and 34.6. This group had 54.1 per cent of the "Plowable pasture" and 86.3 per cent of the "Other pasture" in 1929.

Average size of farms.—Since, for the United States as a whole, the number of farms was less in 1930 than in 1925 or 1920, and since the land in farms in 1930 exceeded that in both 1925 and 1920, it is evident that the average size of farms in 1930 was greater than in either 1925 or 1920. The average size of farm, based on the total acreage, in 1930 was 156.9 acres, in 1925 was 145.1 acres, and in 1920 was 148.2 acres. Also, since the proportion of all farms "Under 20 acres" in size was greater in 1930 than in 1920, and since the proportion in all groups 20 to 174 acres and "260 to 499 acres" had decreased, the increase in the average size of farm must have been due largely to increases in the percentage of all farms 500 acres and over in size. The period 1920 to 1930 showed an increase in the average size of farm for 30 States: the period 1925 to 1930 showed an increase for 40 States; and the period 1920 to 1925 showed an increase for only 9 States.

A good outline of the average size of farms in the different areas is shown in the first map. Farms average lowest in size in the truck, fruit, and cotton areas, and largest in the strictly grazing areas. The other map presents a picture of the average amount of what corresponds closely to the old classification of improved land. This map includes all crop land whether idle or in use in 1929, and also plowable pasture land, excluding only that portion of improved land occupied by buildings, fences, barn lots, etc.

Value of farm property, by size of farm,—Distributions, by size of farm, are given for the value of farm

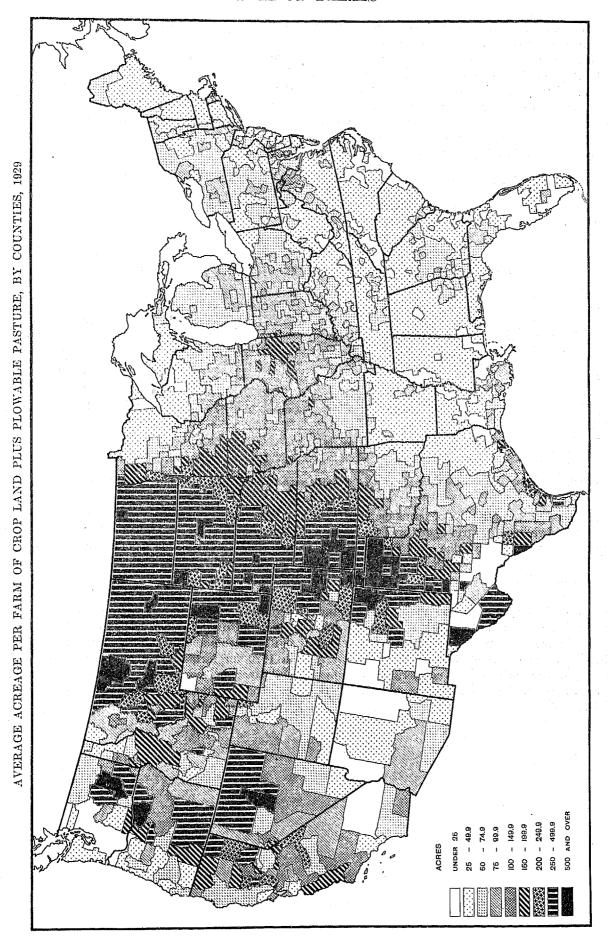

land and buildings (value of farms), and for farm implements and machinery, for all census years beginning with 1900; also, separate distributions of the value of land exclusive of buildings, and of the value of all buildings, are given for the same years, while that for the value of dwellings of farm operators, which forms a part of the value of all farm buildings, is available only for the year 1930.

All 12 size groups are used in presenting the United States summary tables for 1930, while only 7 are used in presenting the statistics for divisions and States for the same year. For earlier years, only 7 size groups are available for any of the data on values.

Value of land and buildings, by size of farm.—In the distribution of the total value of farms among the several size groups of farms classified according to size, the farms of the larger size groups are considerably more important than they are in the distribution of the number of farms, but less important than they are in the distribution of the total farm acreage. This results from the very low percentage of plowable land in the farms of the larger size groups, with an attending lower value per acre.

In the period 1925 to 1930, the value of all farms in the United States declined 3.2 per cent. Farms of 20 to 499 acres in size showed decreases for the period while the farms in the group "Under 20 acres" and farms of 500 acres and over showed increases. For the period 1920 to 1930, the decline in the value of farms for all groups combined was 27.8 per cent. All groups showed considerable decreases with the exception of the group "Under 20 acres," which had an increase of 27.8 per cent.

The value of those farms ranging from 50 to 499 acres in size formed 69.9 per cent of the total value of farms in 1930, against 73.4 per cent in 1925, and 75.5 per cent in 1920. The proportional decline from 1920 to 1930 was greatest in the group "100 to 174 acres," which group also showed the greatest proportional decline in the number of farms and in farm acreage during the same period. The value of farms "Under 20 acres" formed 5.6 per cent of the total value of all farms in 1930, 5 per cent in 1925, and 3.2 per cent in 1920, while the value of farms of 500 acres and over represented 15.7 per cent of the total value of farms in 1930, 13 per cent in 1925, and 13.9 per cent in 1920. The value for each of the groups representing farms between 50 and 499 acres formed a smaller proportion of the total value of farms in 1930 than in 1925, while the value of only the 2 groups comprising farms between 100 and 499 acres formed a smaller proportion in 1930 than in 1920.

The distribution of the value of land alone naturally follows rather closely the distribution of the value of all farms, since the land in most cases represents a very large percentage of the total value of the farm. In the distribution of the value of the buildings, the smaller size groups show a larger percentage of the total value since many of the smaller farms are equipped with expensive buildings. Since 1920, the value of farm buildings has been forming an increasing percentage of

the value of all farms. As shown in Table 6, this has also been true for every size group. But the value of farm land exclusive of buildings in 1930 still formed 73 per cent of the total value of all farms, though the percentage varied from 39.6 per cent for farms "Under 3 acres," to 94.9 per cent for farms of "10,000 acres and over." The increase throughout the size groups was continuous with the one exception, "50 to 99 acres."

<sup>&</sup>lt;sup>1</sup> Value of livestock, by size of farm, for 1920 is shown in Volume V of the 1920 cousus reports. Data for livestock, by size of farm, not available for 1930 and 1925, <sup>1</sup> A minus sign (—) denotes decrease,

As a general rule, as the size of farms increased, the value of the dwellings of farm operators formed a decreasing proportion of the value of all farm buildings. It will be noted that the percentage for the group "Under 3 acres," is lower than for the 3 groups immediately following. This may be due in part to the enumeration of many greenhouses on tracts of less than 3 acres which would tend to greatly increase the value of all buildings, whereas the operators' dwellings would either form a small part of the total for all buildings, or, as in other cases, the operators' dwellings were elsewhere and were not included as a part of the establishments.

Value of implements and machinery, by size of farm.—The value of implements and machinery was not tabulated by size of farm in 1925, hence figures are presented only for decennial years. The distribution of the value of this class of farm property follows very closely the distribution of the value of farm land, the departure being most noticeable for farms of "5,000 acres and over." The proportion of the total value of implements and machinery was greater in 1930 than in 1920 for farms "Under 20 acres" and 175 acres and over in size. The greatest proportional gain was shown for the 2 groups "500 to 999 acres" and "1,000 acres and over."

Average values per farm and per acre, by size of farm.—Tables 7 and 8 present the average value per farm and per acre, respectively, of specified classes of farm property for the United States, by size of farm. Similar information is given for geographic divisions and States in Table 13. For the country as a whole, the average value of farms showed a decrease for 1930, compared with both 1925 and 1920, in 6 out of the 7 size groups, the exception being the group "Under 20 acres," whereas when comparing 1925 with 1920 all classes showed a decrease. However, for all buildings the average value per farm showed an increase in all size

groups for 1930 as compared with both 1925 and 1920. The average value of implements and machinery per farm was lower in 1930 than in 1920 for all size groups representing farms under 175 acres, while an increase is shown for all size groups of 175 acres or more.

The average value of all land and buildings per acre shows a decline in 1930 when compared with 1925 and 1920, though for farms "Under 20 acres" the average value for 1930 exceeded that for either 1925 or 1920, while for farms of "1,000 acres and over," the average value in 1930 slightly exceeded that for 1925, but was considerably less than that for 1920.

Table 7.—AVERAGE VALUE PER FARM OF SPECIFIED CLASSES OF FARM PROPERTY (BASED ON ALL FARMS) IN THE UNITED STATES, BY SIZE OF FARM: 1930, 1925, AND 1920

[Statistics for 1930 relate to Apr. 1, and for 1925 and 1920 to Jan. 1. Figu	res for divisions and States in Table 13]
