

FOREIGN-BORN WHITE FAMILIES BY COUNTRY OF BIRTH OF HEAD

INTRODUCTION

This publication is supplementary to the main report on families (Vol. VI of the Fifteenth Census Reports on Population), which contains statistics on foreign-born white families as a group, not classified by country of origin.

This special report was prepared under the supervision of Dr. Leon E. Truesdell, chief statistician for population, assisted by Thomas J. Fitzgerald.

Definition of family.—The term "family," as it is used in this report, is limited to what might be called private families, excluding the institutions and hotel or boarding house groups which have been counted as families in censuses prior to 1930.¹ A family may therefore be defined as a group of persons, related either by blood or by marriage or adoption, who live together as one household, usually sharing the same table. Single persons living alone are counted as families, however, as are a few small groups of unrelated persons sharing the same living accommodations as "partners." Households reporting more than 10 lodgers are classified as boarding or lodging houses rather than as families.

Foreign-born white families.—A foreign-born white family in census usage is a family whose head is a foreign-born white person. Statistics for foreign-born white families of all national origins combined are presented in Volume VI of the Fifteenth Census Reports on Population and in the State bulletins on families, of which that volume is largely made up. In this special report these families are classified according to country of birth of head. The statistics here presented thus make it possible, in studying the groups of foreign-born white population which have come to the United States from different countries, to compare the family characteristics as well as those personal or individual characteristics for which statistics are presented in the general report on population (Vol. II of the Fifteenth Census Reports on Population).

The families of the foreign-born white are to a large extent composite as to nativity, since most of the children, having been born since the parents' arrival in this country, are native; indeed, in a considerable number of cases, the wife as well as the children may be native—most frequently, however, of the second or third generation of the same national stock as her husband. This situation explains the relatively large number of foreign-born white families in proportion to the foreign-born white population; or conversely, the small number of foreign-born white persons per foreign-born white family.

In this report statistics of foreign-born white families by country of birth of head are presented for the United States, for States, for cities of 25,000 or more, and for urban, rural-farm, and rural-nonfarm areas in the United States as a whole and in the several States.

Mexican, Indian, Chinese, and Japanese families.—Similar statistics, somewhat condensed in form, are presented in the Appendix for Mexican, Indian, Chinese, and Japanese families. These four racial groups represent a subdivision into its principal constituent parts of the class designated "Other races," for which statistics are shown in the general classification by color and nativity in the main reports on population and families.

¹ Since the whole number of these quasi-family groups in 1930 is only about 75,000, their exclusion from a total count of nearly 30,000,000 represents only a very slight change from the earlier definition of the "census family."

Mexicans are given a separate classification in the census returns for the first time in 1930, having been included for the most part with the white population at prior censuses. The enumerators' instructions on this point were to the effect that "all persons born in Mexico, or having parents born in Mexico, who were not definitely white, Negro, Indian, Chinese, or Japanese, should be returned as Mexicans." In many of the tables Mexicans are classified by nativity into two groups—Native (that is, born in the United States) and foreign born. Foreign-born Mexicans numbered 616,998, of whom 615,274 were born in Mexico.

Practically all the Indians are native; and the numbers of the Chinese and Japanese seemed to be too small to justify a classification of the family data by nativity of head. Statistics showing the Chinese and Japanese population by nativity are available; but in using these figures in connection with the family data, it should be remembered that, just as in the case of the white population, the percentage of the family heads who are foreign born will be much larger than the percentage of the population.

Country of birth.—The 1930 statistics of country of birth have been tabulated in accordance with present political boundaries, so far as in any way possible. Because many persons from central Europe who left their native land before the World War have not become altogether familiar with the subsequent boundary changes, it has been difficult to secure absolute accuracy in this classification. Persons born in the former Austro-Hungarian Empire, in particular, were inclined to return their country of birth as "Austria," when they were really born in what is now Czechoslovakia or Yugoslavia; or as "Hungary," when they were born in some part of what is now Rumania or Yugoslavia. Likewise, by reason of the difficulty of securing correct returns, some persons born in Latvia, Estonia, or Lithuania may have been assigned to Russia. The classification of families agrees, in any case, with the classification given the family heads in the general population tabulations, so that any computations of foreign-born white persons per family, or of other combinations involving the two sets of figures, will not suffer from lack of consistency in the country of birth classification.

Table 1 shows the foreign-born white families in the United States in 1930 classified according to country of birth of head, with the foreign-born white population classified by country of birth, for comparison.

TABLE 1.—FOREIGN-BORN WHITE FAMILIES BY COUNTRY OF BIRTH OF HEAD, AND TOTAL FOREIGN-BORN WHITE POPULATION BY COUNTRY OF BIRTH, FOR THE UNITED STATES: 1930

Tenure of home.—Since a home is defined as the living quarters occupied by a family, the number of homes is always the same as the number of families. In the classifications by tenure, a home is counted as owned if it is owned wholly or in part by any related member of the family. A home owned by a lodger, however, is classified as rented. A home is counted as rented if it is not owned by any member of the family, even though no specific cash rental is paid. Living accommodations received as a part of a man's salary or wages, or occupied rent free under any other conditions, are thus counted as rented.

Homes occupied by foreign-born white families classified by country of birth of head are shown by tenure, for the United States, in Table 2.

Value or rental of home.—The enumerator was instructed to report on the population schedule, for each nonfarm family owning its home, the approximate current market value of the home,² and for each nonfarm family occupying rented quarters, the monthly rental, or if rental was not paid by the month, then the equivalent monthly rental or the approximate rental value per month.

In the tabulation of the data for foreign-born white families by country of birth the values and the rentals have been assembled into five or six groups,

² The value of the farm homes was obtained on the farm schedule rather than on the population schedule, in order that it might be correlated with other items in the farm census. Since the farm schedule does not show country of birth, these values can not be classified by country of birth.

and the figures presented in the tables represent the number of homes in each of these groups.

Size of family.—In the classification of families according to size, only related persons are counted. Lodgers, resident servants, guests, and foster children or wards are omitted, though a separate count is made of the number of lodgers. Persons related in any way to the head of the family by blood, marriage, or adoption, are counted as members of the family. Most of the 1-person families shown in the classification represent persons living alone, though a small number of so-called partnership families are included in this group; in such families one person has been selected, more or less arbitrarily, as the head, and the others have been counted as lodgers.

Median size and value.—In addition to the classification of families by size and of nonfarm homes by value or rental, medians are presented for size of family and value or rental of home. The median value is the value of the home which would stand in the middle of the series if all of the homes were arranged according to value, beginning with the lowest and ending with the highest.³ It is not possible from the data available to compute the arithmetical average of the value or monthly rental, since no definite value can be assigned to the first value group (under \$1,500) or to the last (\$10,000 and over). The median is, therefore, the most practicable and useful of the summary figures that could be computed.⁴

In connection with the median size of family the general definition of the median as that item or value which stands at the midpoint of the series arranged according to size must be qualified somewhat, since this figure (in common with the average size of family) is presented with a fraction or decimal which must be interpreted in an abstract or theoretical sense rather than literally. When the median size of all foreign-born white families in the United States is shown as 3.74 this does not mean that there are 3.74 persons in any family, any more than the average size, 4.08, means that there are 4.08 persons in any actual family. In the tabulation on which the computation of the median is based, the families are arranged in groups having, respectively, one person, two persons, three persons, four persons, etc., per family. If the midpoint in the series of families thus arranged is located exactly in the middle of the 3-person group, then the median will be exactly three. In this case it will be necessary

³ Medians are computed in accordance with the following formula:

$$M = L + \frac{\left(\frac{N}{2} - k\right)c}{f}$$

in which

M = the median.

L = the lowest value in the median group—the group in which the median or middle item (family) falls.

N = the whole number of items (families).

k = the number of items (families) in the groups preceding the median group.

c = the group interval. (In the computations for median size of family, *c* = 1.)

f = the number of items (families) in the median group.

In computing the median value (or rental), families not reporting value (or rental) are excluded from the computation; that is, *N* = number of families reporting value (or rental).

In computing the median size of family, since the families grouped according to size constitute a discrete series, it is necessary to assume that the group value stands in the middle of the group. This means that when the median is in the 3-family group, for example, the lower and upper limits of the group are assumed to be 2½ and 3½, respectively, whence *L* = 2½.

⁴ The median values for the homes occupied by all foreign-born white families are based on the complete value classification used in the general tabulation showing 10 groups ranging from "Under \$1,000" to "\$20,000 and over," and are therefore somewhat more accurate than the medians shown for families by country of birth which are necessarily based on a condensed classification showing only 6 value groups and only 5 rental groups.

to take or pass over all of the 1-person and 2-person families and one-half of the 3-person families in order to reach the midpoint. If, however, it is necessary to take, say, three-fourths of the 3-person families in order to reach the midpoint, the median will be one-fourth of a unit higher, or 3.25. Similarly, if only four-tenths of the 3-person families are needed to reach the midpoint, the median will be one-tenth of a unit lower, or 2.90.

In actual use, however, it is not necessary to keep in mind the process of obtaining or finding the median; it may simply be accepted as a convenient summary figure representing the size of family (or the value or rental of the home) in the various areas and the various population classes. Medians of 3.03 for the Danish families and 4.65 for the Italian families, for example, indicate that the Italian families are much the larger and give a definite measure of the difference in size.

In comparing the median size of family as shown in the tables by country of birth, allowance must be made for the fact that most of those who came to the United States from certain countries, such as Sweden and Germany, came a rather long time ago, so that most of the heads of families are past middle age and their children have grown up and established families of their own, while from certain other countries, such as Italy, Poland, and Czechoslovakia, the immigration has been relatively recent, and a large percentage of the heads of families still have most of their children living in the home.

Children under 10 years old.—In making a classification of families by number of children, the age limit of 10 years was selected as affording a better measure of fecundity than higher or lower age limits. At ages under 10 all of the living children are likely to be enumerated with their parents, giving a complete record of the children of those ages; and there is less likelihood of the inclusion of grandchildren, nephews, nieces, etc. In the tabulation of children under 10, however, all children within this age period are counted who are related in any way to the head of the family, either by blood or by adoption, as it was impracticable to restrict the count to the children of the head of the family. In the aggregate, though, the number of grandchildren, nephews, nieces, and others not sons or daughters of the head of the family who are thus included is relatively small.

As suggested in connection with the median size of family, in making comparisons between families of different national origins on the basis of the number of children under 10 years old in the families, consideration should always be given to other factors affecting the comparison, such as the probable age of the head of the family and the social status of the families within the areas or classes under consideration.

Gainful workers.—In the classification of families according to the number of gainful workers all related members of the family who were returned as usually working at a gainful occupation are counted, including some who were temporarily unemployed at the time of the census. Gainfully employed lodgers or boarders are not counted. In general, it may be said that the number of gainful workers includes those persons who are presumably contributing to the family income. The families reporting no gainful workers are mainly those of widows and of elderly men who have retired from active employment.

Lodgers.—In the classification of families according to the number of lodgers certain other persons besides those specifically returned as lodgers or boarders are included. The more important of these are farm laborers living with the farm family, foster children or wards, and guests. On the other hand, it should be noted that no household having more than 10 lodgers is included in the classification of private families.

Urban, rural-farm, and rural-nonfarm areas.—Urban population, as defined by the Census Bureau, is in general that residing in cities and other incorporated places having 2,500 inhabitants or more, the remainder being classified as rural. In three of the New England States—New Hampshire, Massachusetts, and Rhode Island—towns (townships) are classified as urban if they have a population of 2,500 or more and certain urban characteristics; and a few large and densely populated townships in other States are likewise classified, even though not formally incorporated as municipalities.

In addition to the classification of the population as urban and rural, the rural population is subdivided into rural-farm and rural-nonfarm, on the basis of the replies to a question reading, "Does this family live on a farm?" The rural-farm population includes all persons living on farms in the rural areas. The rural-nonfarm or "village" population is made up largely of persons living in small towns or villages both incorporated and unincorporated, though in many areas there are considerable numbers of families living in the open country but not on farms.
