CHAPTER 3.—SEX DISTRIBUTION

INTRODUCTION

The distribution by sex of the white population of the United States has been ascertained at every Federal census, but data on this subject for the total population were collected for the first time in 1820.

The distribution of the population by sex is a fundamental classification, essential to the proper interpretation of almost every other phase of population statistics. The sex distinction is therefore extensively presented in correlation with other classifications. This chapter is devoted mainly to a consideration of the relative numerical importance of the two sexes in different sections of the country and in the principal color, nativity, and parentage classes of the population.

The question as to sex is the simplest inquiry on the population schedule. There is no ambiguity of terms, and but rarely any motive for misrepresenting the facts to the enumerator. The sex classification of the population as a whole may therefore be accepted as the most dependable of all the classifications. Imperfect returns as to color, nativity, or parentage are more likely to occur, however, in the case of males than in the case of females, since males predominate among the foreign born and among the floating population, for both of which classes accurate information is sometimes difficult to obtain. A certain number of foreign-born persons, for example, are likely to be returned as native; and of these, far more will be males than females. From such sources may arise slight errors in the sex distribution of the several classes of the white population, but these will not be large enough to affect appreciably the sex ratio—that is, the number of males per 100 females.

Total population.—The statistics relating to the sex distribution of the population of continental United States, as returned at the Fifteenth Decennial Census, are summarized in Table 1, and comparative figures are presented for prior censuses. Statistics relating to sex distribution for the population of all the outlying possessions except the Philippine Islands are given in the special report entitled "Outlying Territories and Possessions."

The following statement shows the excess of males in the total population for each census year beginning with 1820.

CENSUS YEAR	Excess of males	CENSUS YEAR	Excess of males	CENSUS YEAR	Excess of males
1030.....	1,490,114	1890.....	1,526,488	1850.....	483,444
1920.....	2,090,242	1880.....	881,857	1840.....	307,611
1910.....	2,092,288	1870.....	428,759	1830.....	198,958
1900.....	1,638,321	1860.....	727,087	1820.....	164,757

This preponderance of males is due in part to the fact that the total population includes a considerable proportion of foreign-born persons, among whom the males greatly outnumber the females; but in the most important class of the native population, namely, the native whites of native parentage, there is also a marked excess of males.

White population.—The preponderance of males over females in the white population is due in part to the abnormal sex distribution of the foreign-born whites, but among the native whites also the males outnumbered the females in 1930 by 522,490. This excess, however, occurs only among the native whites of native parentage, the foreign-parentage and mixed-parentage groups both showing an excess of females in 1930. (See Table 1.)

The preponderance of males among the native whites of native parentage has appeared at each census beginning with that for 1890, at which the distinction between native and foreign parentage was first made by sex. For all native whites combined an excess of males has also been shown at each census beginning with 1850, when the classification according to nativity was first made.

The sex ratio for the total native white population has shown a decline at each census since 1890. This reduction has been particularly rapid since 1910. Between 1910 and 1920, emigration, war losses, and increase in military and naval services stationed abroad at the time the 1920 census was taken and therefore not included in the population of continental United States, all contributed to a relative decrease in the male population. In general, however, the reduction in the sex ratio is mainly due to the rapid fall in the birth and death rates and the consequent aging of the population. In every population, there is a preponderance of male births, but the death rate of males, both in early and in late age periods, is higher than that of females. Consequently, a decreased proportion of children in the population relative to that of adults will result in a decline in the sex ratio.

The sex ratios for the native whites of native parentage, of foreign parentage, and of mixed parentage have all declined about equally since 1910.

The ratio for the foreign-born white population has declined sharply since 1910. In that year, following a decade of heavy immigration, the sex ratio of the foreign-born whites was 129.2. In 1920 it had fallen to 121.7, and in 1930 to 115.1, the lowest ratio since 1860. Under free immigration there was always a

large surplus of males over females in the foreign-born population, but with the outbreak of the World War many thousands of males returned to their native countries for military service. Since the World War, under selective immigration, the surplus of males has been more than balanced by the still larger surplus of males among emigrant aliens, so that in the net accession to the population from abroad there has been an actual excess of females. With restricted immigration the foreign born are rapidly aging. The median age of the foreign-born white population increased from 40 years in 1920 to 44 years in 1930. Since there are still many more males than females surviving in the older generation of immigrants, and since the death rate of males in the older age groups exceeds that of females, the excess of males is being rapidly reduced. With the continuance of present conditions, the sex ratio of the foreign-born white population will decline rapidly until there is an actual excess of females over males.

Negro population.—Differing from all other races, the Negroes have shown an excess of females over males at every census since and including that of 1840, although the returns for 1820 and 1830 showed a preponderance of males. The relative excess of females in 1930 was greater than that shown at any previous census except that of 1870.

Indian population.—At every census except that of 1870 the Indian population has shown an excess of males. No attempt was made, however, to secure a complete enumeration of this race prior to 1890, and it is doubtful whether the figures for earlier census years are of any material value as showing the true sex ratio of the total Indian population. The more recent returns also are subject to a somewhat greater margin of error than are those for the other races, by reason of the effort to count as Indian all persons having any trace of Indian blood. It is likely that some persons in whom the admixture of Indian blood was so slight as not to be readily noticeable were reported as white, and there may have been differences between the two sexes in regard to the frequency of this occurrence.

Mexican population.—Persons of Mexican birth or parentage who were not definitely returned as white or Indian were designated "Mexican" in 1930, and included in the general class of "Other races." In prior censuses most Mexicans have been classified as white. The fact that these persons were included with the white population in 1920, but were given a separate classification in 1930, affects slightly the comparison of the 1930 and 1920 data by sex as they are presented in this chapter. In the States near the Mexican border the sex ratio of the Mexicans does not differ radically from that of the total white population, but in more distant States, where the Mexican population is made

up largely of workers without families, the sex ratio of the Mexican element is more like that of the foreign-born white.

Using as a basis the 1920 returns for persons born in Mexico, and persons having one or both parents born in Mexico, it has been estimated that there were in the United States in that year 700,541 persons who would have been classified as Mexican under the 1930 instructions.¹ These may be compared with 1,422,533 persons returned as Mexican in 1930. Similarly it has been estimated that the white classification in 1910 included 367,510 persons who would have been counted as Mexican in 1930. The estimates of the number of Mexicans in 1920 are presented in Table 1, together with adjusted figures for the white population obtained by deducting the estimated numbers of Mexicans. In the detailed tables giving statistics for States and cities, however, the presentation is limited to the Mexicans returned in 1930 and the white population as reported, without adjustment for Mexicans.¹ The effects of this change in classification on the comparability of the sex ratios is of course limited to those areas in which an appreciable number of Mexicans are shown for 1930.

Chinese, Japanese, and "All other" population.—Among the Chinese, Japanese, and other minor elements of the population, the excess of males is very great, although there has been a pronounced decrease in the sex ratio from census to census since 1890 in the case of the Chinese, and since 1900 in the case of the Japanese. The excess of males among the immigrants of these races has been much greater than that in any other immigrant group. From the passage of the Chinese exclusion law, until 1920, the number of Chinese males in the United States steadily declined, chiefly because of deaths among the older Chinese immigrants. The number of females, however, has shown a steady increase since 1890, and the sex ratio has declined rapidly. The census of 1930 shows an increase in the total Chinese population nearly equal in numbers as between the sexes, but proportionally much greater for females than for males. The Japanese population has shown an increase at each census since 1870, when it was first separately enumerated, but the increase among Japanese males since 1910 has been comparatively slow, while the increase in the number of females has been rapid. The sex ratio in 1930 had declined to 143.3. In the absence of further immigration, the natural increase in the Japanese population, together with the larger number of deaths among males than among females, will bring the proportion of the sexes nearer to equality.

¹ The estimated numbers of Mexicans in 1920 are shown in some detail in chs. 6, 7, and 8 of this volume, with sex as incidental features, having been worked out after the material in the present chapter was in type.

Urban and rural population.—Since there are marked differences in the sex distribution of the population of urban and rural areas, statistics are presented for the urban and rural population, by sex, in Table 5.

Urban population, as defined by the Census Bureau, is in general that residing in cities and other incorporated places having 2,500 inhabitants or more, the remainder being classified as rural. In three of the New England States, New Hampshire, Massachusetts, and Rhode Island, conditions are exceptional in that the compactly built portions of towns (townships) are not separately incorporated or politically distinct in any way from the rural territory within the same town; nor is it the usual practice to incorporate even the larger places as cities until they attain a population in excess of 10,000. Consequently, if only cities were counted as urban the classification would be quite inadequate. In 1920 and 1910 all towns in these States which had a population of 2,500 or more were classified as urban. This resulted in the inclusion of a considerable number of places that were mainly rural in their general characteristics. In 1930 the special rule for these States has been modified so as to place in the urban classification, in addition to the regularly incorporated cities, only those towns in which there is a village or thickly settled area having more than 2,500 inhabitants, and comprising, either by itself or when combined with other villages in the same town, more than 50 per cent of the total population of the town.

One other modification has been made in the definition of urban population for use in connection with the 1930 census. This modification extends the definition so as to include townships and other political subdivisions (not incorporated as municipalities, nor containing any area so incorporated) which had a total population of 10,000 or more, and a population density of 1,000 or more per square mile.

Since it has been found impracticable to go back and readjust to the new basis the 1920 urban and rural figures as they are tabulated by color, sex, age, etc., they are presented in all tables as established in 1920. The comparative figures, therefore, show differences in a few cases which must be considered or interpreted as solely or mainly the result of the change in the method of classification.

The ratio of males to females is decidedly higher in rural than in urban communities, not only for the total population but for each of its elements except the numerically unimportant group designated "Other races." (See Table 7.)

This difference between urban and rural communities in regard to the sex distribution of the principal classes

of the population—which exists despite the fact that the foreign born, among whom the males considerably outnumber the females, are more numerous in urban than in rural communities—is doubtless due primarily to the fact that the cities afford many more opportunities for the gainful employment of women than do the rural districts.

Rural-farm and rural-nonfarm population.—In addition to the classification of the population as urban and rural, which is based on the size (number of inhabitants) and the political status (municipal incorporation) of the geographic unit in which the persons live, the population, both urban and rural, is further classified as farm and nonfarm, on the basis of a question reading "Does this family live on a farm?"

For the farm population living in urban territory, which forms less than 1 per cent of the total farm population, no detailed tabulations were made; hence the presentation of classified data for the farm population is limited to that part living in rural territory and designated as rural-farm population. This is done partly to simplify the classification (dividing the total population into three groups, namely, urban, rural-farm, and rural-nonfarm) and partly because it is felt that in general the farm families living within the corporate limits of cities or other incorporated places are living under conditions at least somewhat urban, rather than under typical farm conditions.

The rural-nonfarm or "village" population is made up largely of persons living in small towns or villages, both incorporated and unincorporated, though in many areas there are considerable numbers of families living in the open country but not on farms.

In the matter of sex distribution, as between the two subdivisions of the rural population, the rural-farm usually shows a much higher proportion of males than the rural-nonfarm, mainly because there is more opportunity for employment on farms for men than for women.

Geographic areas.—Statistics are presented in this bulletin for continental United States as a whole; for nine groups of States designated geographic divisions; for the three main sections of the country (the North, the South, and the West), for all cities having a population of 25,000 or more in 1930; for urban and rural areas, and for the two subdivisions of the latter, designated rural-farm and rural-nonfarm. The North includes the New England, Middle Atlantic, East North Central, and West North Central divisions; the South includes the South Atlantic, East South Central, and the West South Central divisions; and the West includes the Mountain and Pacific divisions.

SEX DISTRIBUTION

TABLE 1.—POPULATION OF THE UNITED STATES BY SEX, COLOR, AND NATIVITY: 1790 TO 1930

[Per cent not shown where base is less than 100; sex ratio not shown where number of females is less than 100. A minus sign (—) denotes decrease]

SEX DISTRIBUTION

TABLE 6.—POPULATION BY SEX, COLOR, AND NATIVITY, 1930, WITH NUMBER OF MALES PER 100 FEMALES, 1900 TO 1930, BY DIVISIONS AND STATES

[Mexicans were not returned as a separate class prior to 1930, but were counted with the white population; hence there are no comparative figures for the earlier censuses. See more detailed explanation in text. This situation frequently explains the lack of comparative figures for the group designated "Other races," which in 1930 included the Mexicans. Sex ratio not shown where number of females is less than 100]

TABLE 9.—POPULATION BY SEX, COLOR, AND NATIVITY, 1930, WITH NUMBER OF MALES PER 100 FEMALES, 1900 TO 1930, FOR CITIES OF 25,000 OR MORE

[Mexicans were not returned as a separate class prior to 1930, but were counted with the white population; hence there are no comparative figures for the earlier censuses. See more detailed explanation in text. This situation frequently explains the lack of comparative figures for the group designated "Other races," which in 1930 includes the Mexicans. Sex ratio not shown where number of females is less than 100]

CITY AND CLASS OF POPULATION	Male, 1930	Female, 1930	MALES PER 100 FEMALES				CITY AND CLASS OF POPULATION	Male, 1930	Female, 1930	MALES PER 100 FEMALES			
			1930	1920	1910	1900				1930	1920	1910	1900
