

# CHICKENS AND CHICKEN EGGS ON FARMS

## INTRODUCTION

This report presents poultry data by counties in compact and convenient form. Most of these statistics are arranged in groups according to the size of flocks, in order to bring out the differences in large and small scale operations. The principal items covered are—Number of farms reporting any chickens or eggs, and number of chickens on hand over 3 months old, April 1, 1930; and number of chickens raised, chickens sold, eggs produced, eggs sold, and value of specified poultry products in 1929.

For census purposes a "farm" is all the land directly farmed by one person either by his own labor or with the aid of his family or hired help. When a landowner had one or more tenants, renters, croppers, or managers, the land operated by each was considered a farm. Also, if agricultural commodities worth \$250 were produced, the operation was considered as a farm even if less than 3 acres of land were occupied.

This point is especially important, as many poultry operations, conducted on small tracts of land, were of sufficient magnitude to qualify as farms although not popularly so designated. City and village operations which did not produce \$250 worth of poultry and eggs, or which did not fall within the farm definition because of other farm activities, are not included.

In regard to the classification it must be noted that the size groups were based on the number of chickens on hand over 3 months old, April 1, 1930, while all production items were for the year 1929. Proper consideration should also be given the following points in the use of these statistics:

1. The flocks included male birds and any fall chickens not yet matured, so that the calculation of eggs per fowl is a ratio of eggs "per chicken on hand," April 1, 1930, and not "eggs, per hen, laid in 1929."

2. The inventory of grown chickens in most of the United States is at a low point in April, as the flocks have been reduced to the essential laying and breeding birds by that time, and there are relatively few fall pullets not yet laying.

3. April is within the period of high production and data secured at that time are influenced by that fact.

4. The number of farms reporting chicken eggs produced is not shown, as it closely approximates the number of farms reporting chickens on hand over 3 months old, April 1, 1930.

Analysis of the data brings out a number of interesting facts, among which are—The preeminence of California in large-scale poultry farms; the rather constant increase in production per fowl as the size of flock increases; the percentage of chickens and eggs sold in the main poultry areas compared with areas of small production; the difference in number of eggs produced on commercial poultry farms compared with casual farm production.

In analyzing these data, caution is suggested against drawing unwarranted conclusions for small areas and groups. The State and United States totals, however, present for the first time very reliable poultry data based upon the size of operations.

UNITED STATES SUMMARY.—CHICKENS AND POULTRY PRODUCTS—SELECTED ITEMS  
 APRIL 1, 1930; AND OTHER ITEMS NOT CLASSIFIED;

[For individual items by counties,
