

CHAPTER VII

APPRAISAL OF RESULTS AND SOME OF THE WAYS THEY MAY BE USED

In the foregoing study the agriculture of the United States has been analyzed in considerable detail. The primary objective in view throughout has been to present as accurate a picture of farming systems and farming conditions in different parts of the country as possible with the data available. Possibly in some cases the differentiation of subareas has been pushed too far for practical use, while in other cases there may have been insufficient refinement. With more detailed data by townships some of the dividing lines between type of farming areas could have been made more distinct and clear cut. With more space available a much better picture of the prevailing farming systems in the United States also could have been shown. A large number of the frequency distributions made were not presented because of lack of space. The discussion relating to the causal factors determining types of farming in the different parts of the country likewise would be improved if it were particularized more. While these limitations detract from the study somewhat, they do not seriously mar the general results or destroy the detailed picture it gives of the farming in the United States.

The uses to which the results may be put are many. Probably their greatest value will come not so much in specific studies as in the detailed picture and background they give of our agricultural resources and how they are utilized by different producing groups. They provide a mass of information which will be of much value to students and agricultural workers generally, interested in becoming more familiar with our agriculture.

The results also will be of direct research value in many studies. Probably they will lend themselves most readily to land utilization and farm management studies. The differentiation of the agriculture of the United States into type-of-farming areas localizes the agricultural problem by defining areas within which the problems of production are similar. These will be of direct use to the investigator in locating his area of study and in defining its limits for sampling. To the extension man, on the other hand, they will indicate to what limits generalization likely will apply.

The type-of-farming areas also will be of value in many other ways. Many of our basic agricultural data, for example, would be of more significance if they related to type of farming areas instead of to political units as at present. Likewise, studies made with the view of obtaining methods and practices from which general standards are to be derived would be more representative if confined to type of farming areas. The same is true of farm income, elasticity of supply and many other studies.

Typical farming systems, of the kind presented in Chapter VI, provide a means for testing the probable effect of both long and short time adjustments in farming under varying methods and degrees of efficiency in production as well as under varying prices of products and cost of goods. They not only indicate the amount of variation found in crop and livestock combinations, but at the same time indicate what proportion of the farmers on particular types and sizes of farms follow given organizations. That such material will be of a great deal of value in providing a better understanding of the agricultural problem in the United States seems clear. If the study in small measure throws light upon this perplexing problem it will have justified the effort spent upon it.

TABLE 17.—NUMBER OF SPECIFIED CROP-SPECIALTY FARMS IN SANTA BARBARA COUNTY, CALIF., CLASSIFIED BY SIZE OF FARM, ACCORDING TO ACREAGE IN BEANS, AND IN BEANS AND HAY HARVESTED PER FARM; BY ACREAGE (GROUPS) IN BEANS HARVESTED, PER FARM, CENSUS OF 1930
