PREFACE

This report presents statistics from the 1960 Census of Population on the age at first marriage of the population. Legal provision for this census, which was conducted as of April 1, 1960, was made in the Act of Congress of August 31, 1954 (amended August 1957), which codified Title 13 United States Code.

The major portion of the information compiled from the 1960 Census of Population appears in Volume I, <u>Characteristics of the Population</u>, which contains data for the United States, States and counties and their urban and rural parts, cities, minor civil divisions, etc. The present report is part of Volume II, <u>Subject Reports</u>, and is designated as PC(2)-4D. A list of the Volume II Subject Reports appears on the inside of the front cover. A summary description of all the final reports of the 1960 Population Census appears on page IV.

ACKNOWLEDGMENTS

Robert Parke, Jr., and David M. Heer, with the assistance of Jerry T. Jennings of the Family and Fertility Statistics Branch, planned this report and developed its content, under the general direction of Paul C. Glick, Assistant Chief (Demographic and Social Statistics Programs), Population Division. Henry S. Shryock, Assistant Chief (Program Development), and David L. Kaplan, Assistant Chief (Methods Development), made important contributions in the planning and development of the entire series of Subject Reports. For the present report, John C. Beresford provided liaison with the operations staff, Elizabeth A. Larmon assisted in the preparation of the introductory text, and Louise L. Douglas performed the technical editorial work. The procedures for compiling the data were devised by Catherine M. Neafsey, Margaret P. Brooks, and Anthony B. Woodell of the Systems Division. The sampling materials were prepared by Robert H. Hanson and Warren J. Mitofsky of the Statistical Methods Division.

The census program was designed in consultation with a number of advisory committees and many individuals in order to maximize the usefulness of the data. Among the groups organized for this purpose were the Technical Advisory Committee for the 1960 Population Census, the Council of Population and Housing Census Users, and the Federal Agency Population and Housing Census Council (sponsored by the U.S. Bureau of the Budget). The persons who served with these groups represented a wide range of interest in the census program; their affiliations included universities, private industry, research organizations, labor groups, Federal agencies, State and local governments, and professional associations.

Preparation of the data in this report was made possible, in part, by funds provided by the U.S. Public Health Service (Research Grant CH-00075, formerly GM-08262) to the American Public Health Association for a series of monographs on vital and health statistics. Tabulations for the present report were made as part of the research for a monograph on marriage and divorce in the United States which is being prepared by Hugh Carter, formerly of the National Center for Health Statistics, and Paul C. Glick of the Bureau of the Census.

May 1966.

Ш

FINAL REPORTS OF THE 1960 CENSUS OF POPULATION

The final reports of the 1960 Population Census are arranged in three volumes and a joint Population-Housing series of censu tract reports. The 1960 Population Census publication program also includes preliminary, advance, and supplementary reports, cer tain evaluation, procedural, and administrative reports, and graphic summaries. After publication, copies of all reports ar available for examination or purchase at any U.S. Department of Commerce Field Office.

Certain types of unpublished statistics are available for the cost of preparing a copy of the data. Also, under certain con ditions, special tabulations of the 1960 Census data can be prepared on a reimbursable basis. In addition, there are availabl for purchase magnetic tapes and punchcards containing 1960 Census information on the characteristics of a one-in-a-thousand and one-in-ten-thousand sample of the population of the United States. Confidentiality of the information, as required by law, ha been maintained by the omission of certain identification items. Further information about any of these materials can be obtaine by writing to the Chief, Population Division, Bureau of the Census, Washington, D.C., 20233.

Volume I. Characteristics of the Population. This volume consists of separate reports for the United States, each of the 5-States, the District of Columbia, Puerto Rico, Guam, Virgin Islands, American Samoa, and Canal Zone. For each of these 57 areas the data were first issued in four separate paper-bound "chapters," designated as PC(1)-A, B, C, and D. (For Guam, Virgin Islands American Samoa, and Canal Zone, the material normally contained in chapters B, C, and D are included in chapter B.) For librar; and general reference use, the paper-bound reports have been assembled and reissued in buckram-bound books identified as Parts 1 and 1 to 57 of Volume I.

- Series PC(1)-1A to 57A: Chapter A. Number of Inhabitants. These reports contain final population counts for States and counties and their urban and rural parts, and for standard metropolitan statistical areas, urbanized areas, all incorporated places, unincorporated places of 1,000 inhabitants or more, and minor civil divisions.
- Series PC(1)-1B to 57B: Chapter B. General Population Characteristics. These reports present statistics on sex, age, marital status, color or race, and relationship to head of household for States and counties and their urban and rural parts, and for standard metropolitan statistical areas, urbanized areas, places of 1,000 inhabitants or more, and minor civil divisions.
- Series FC(1)-1C to 53C: Chapter C. General Social and Economic Characteristics. These reports cover the subjects of nativity and parentage, State of birth, country of origin of the foreign stock, mother tongue, place of residence in 1955, year moved into present house, school enrollment by level and type, years of school completed, families and their composition, fertility, veteran status, employment status, weeks worked in 1959, year last worked, occupation group, industry group, class of worker, place of work, means of transportation to work, and income of persons and families. Each subject is shown for some or all of the following areas: States and counties and their urban, rural-nonfarm, and rural-farm parts, standard metropolitan statistical areas, urbanized areas, and urban places.
- Series FC(1)-1D to 53D: Chapter D. Detailed Characteristics. These reports present most of the subjects covered in chapter C, above, cross-classified by age, color, and other characteristics. There is also included additional information or families, as well as data on single years of age, detailed occupation, and detailed industry. Each subject is shown for some or all of the following areas: States and their urban, rural-nonfarm, and rural-farm parts; and large counties, cities, and standard metropolitan statistical areas.

Volume I, Part A: Number of Inhabitants. This is a compendium of the 57 chapter A reports, i.e., PC(1)-1A to 57A.

Volume I, Parts 1 to 57: Characteristics of the Population. The 57 parts relate respectively to the United States, each of the 50 States, District of Columbia, Puerto Rico, Guam, Virgin Islands, American Samoa, and Canal Zone. Each part contains the data previously published in the four chapters A, B, C, and D, and is in the form of a separate, buckram-bound book. Parts 54, 55, 56, and 57--for Guam, Virgin Islands, American Samoa, and Canal Zone, respectively--are bound in a single book.

Volume II (Series PC(2) reports). Subject Reports. Each report in this volume concentrates on a particular subject. Detailed information and cross-relationships are generally provided on a national and regional level; in a few reports data for States or standard metropolitan statistical areas are also shown. Among the characteristics covered are ethnic origin and race, fertility, families, migration, education, employment, unemployment, occupation, industry, and income. There is also a report on the geographic distribution and characteristics of inmates of institutions. A list of reports is given on the inside of the front cover.

Volume III (Series PC(3) reports). Selected Area Reports. Four of the reports in this volume present selected characteristics of the population for State economic areas, for standard metropolitan statistical areas, and according to the size and type of place where the individual resided. A fifth report provides data on the social and economic characteristics of Americans overseas.

Series PHC(1). Census Tract Reports. These reports present information on both population and housing subjects. There is one report for each of 180 tracted areas in the United States and Puerto Rico. The population subjects include age, race, marital status, country of origin of the foreign stock, relationship to head of household, school enrollment, years of school completed, place of residence in 1955, employment status, occupation group, industry group, place of work, means of transportation to work, and income of families, as well as certain characteristics of the nonwhite population in selected tracts. The housing subjects include tenure, color of head of household, vacancy status, condition and plumbing facilities, number of rooms, number of bathrooms, number of housing units in structure, year structure built, basement, heating equipment, number of persons in unit, persons per room, year household head moved into unit, automobiles available, value of property, and gross and contract rent, as well as certain characteristics of housing units with nonwhite household head for selected tracts. In addition, for selected tracts these reports contain data on certain population and housing subjects for persons of Puerto Rican birth or parentage and for white persons with Spanish surname. (This series is the same as the tract reports listed in the publication program for the 1960 Census of Housing.)

REGIONS AND GEOGRAPHIC DIVISIONS OF THE UNITED STATES

Age at First Marriage

GENERAL

This report presents statistics from the 1960 Gensus of Population on characteristics of persons 14 years old and over by age at first marriage. Among the characteristics shown are: age at census, year of first marriage, marital status, whether married more than once, sex, race or color, nativity and parentage, country of origin, education, occupation, and income in 1959. Statistics by age at first marriage are shown also for white persons of Spanish surname, for Puerto Ricans, and for married couples without own household. In addition, this report presents average annual rates of first marriage per 1,000 single persons 14 to 44 years old in 1958 and 1959, by education, occupation, income in 1959, age, color, and sex.

Most of the statistics are shown for the United States, urbanized areas, and the South. In addition, several tables present data by detailed type of residence and by regions. Rates of first marriage by age are shown by States.

All of the statistics shown in this report are based on a 5-percent sample.

RELATED REPORTS

1960 Census reports. -- Statistics on age at first marriage for women 35 to 54 years old, by number of children ever born, marital status, color, and age at census, for the United States, its urban and rural parts, and for the South are shown in 1960 Census of Population, Final Report PC(2)-3A, Women by Number of Children Ever Born. That report also shows data on year of first marriage, by age at first marriage, and color, for ever-married women 15 years old and over, for the United States, urbanized areas, and the South. Statistics on age at first marriage and year of first marriage of heads of husband-wife families, by selected characteristics of the family head, for the United States, urban and rural, and for regions, are shown in Final Report PC(2)-4A, Families. All of these statistics are based on a 5-percent sample.

<u>1950 Census reports</u>.--Statistics on the social and economic characteristics of women 15 to 59 years old who had been married, separated, divorced, or widowed for specified periods of time before the date of enumeration, and statistics on the age at which women entered their current marital status, were shown in <u>1950</u> <u>Census of Population</u>, Volume IV, Part 2, chapter E, <u>Duration of Current Marital Status</u>. Statistics on duration of marriage for women 15 to 49 years old married once with husband present, by number of children ever born, and color, were shown in <u>1950 Census of</u> <u>Population</u>, Volume IV, Part 5, chapter C, <u>Fertility</u>.

1940 Census reports.--Statistics on duration of first marriage and age at first marriage for 1940, and on duration of first marriage for 1910 were published in reports of the 1940 Census which appear under the general title Differential Fertility--1940 and 1910.

Current Population Reports.--Data on age at first marriage based on the Current Population Survey are occasionally published in <u>Current Population Reports</u>, Series P-20. Data on age at first marriage for evermarried women in the civilian noninstitutional population were shown by year of first marriage, age, color, and marital status, in Series P-20, No. 108, "Marriage, Fertility, and Childspacing: August 1959." Additional statistics on age at first marriage for earlier years were presented in Series P-20, Nos. 21, 23, 50, and 67.

AVAILABILITY OF UNPUBLISHED DATA

The data shown in the present report represent the full detail printed out by the computer system. The detail shown for the United States was tabulated separately for each State and was stored on magnetic tape but not printed out. Requests for unpublished data, giving a specific description of the figures desired, may be made by writing to the Chief, Population Division, Bureau of the Census, Washington, D.C., 20233. Inquiries concerning unpublished data should be transmitted to the Bureau as soon as possible because tape files are not maintained indefinitely.

DEFINITIONS AND EXPLANATIONS

Some of the definitions used in 1960 differ from those used in 1950. These changes were made after consultation with users of census data in order to improve the statistics, even though it was recognized st that comparability would be affected. The definitions and explanations should be interpreted in the context ex of the 1960 Censuses, in which data were collected by the statistics of the statistics.

a combination of self-enumeration, direct interview, and observation by the enumerator.

The definitions below are consistent with the instructions given to the enumerator. As in all surveys, there were some failures to execute the instructions exactly. Through the forms distributed to households, the respondents were given explanations of some of the questions more uniformly than would have been given in direct interviews. Nevertheless, it was not feasible to give the full instructions to the respondents, and some erroneous replies have undoubtedly gone undetected.

More complete discussions of the definitions of population items are given in <u>1960 Census of Popula-</u> <u>tion</u>, Volume I, <u>Characteristics of the Population</u>, Part 1, <u>United States Summary</u>, and in each of the State parts.

AGE AT FIRST MARRIAGE AND RELATED TOPICS

Whether married more than once.--In the 1960 Census information on whether the person was married more than once was determined by a direct question for all persons ever married (see below).

Year of first marriage.--The year of first marriage for all ever-married persons was obtained from answers to the following questions on the Household Questionnaire:

This information was then transcribed to the sample FOSDIC schedule as follows:

If information on these items had not been entered on the Household Questionnaire for an ever-married person, the enumerator was instructed to ask the questions. The enumerator was instructed to find out the date of marriage for the husband and enter this also for the wife if both the man and wife had been married only once. If either had been married more than once, the enumerator asked for the date of first marriage of each. If a person had been married before 1890, the enumerator marked 1890 and found out in which calendar quarter the marriage occurred. When the year of first marriage was known and the month was not, the enumerator attempted to determine the season in which the marriage took place. When the year was unknown, the enumerator tried to find out, as accurately as possible, how many years ago the person was first married. Using this information, and month of marriage, the enumerator obtained year of marriage by subtraction; where both month and year were unknown, the enumerator obtained year of first marriage from information on the number of years since first marriage, if available, on the assumption that the month of marriage was between April and December.

All persons who first married in the same period may be regarded as members of the same marriage cohort. For information on uses and limitations of the data in the present report for cohorts of persons married many years ago, see the section below on "Uses and limitations of the data."

Years since first marriage.--The number of years since the person's first marriage was derived by subtracting the date of first marriage from April 1, 1960, and represents the interval in completed years.

Age at first marriage.--In this report, age at first marriage is shown in completed years for all ever-married persons. In tables showing age at first marriage by age at census, the data are based on persons who were 14 to 79 years old at the census date. The upper limit was set at 79 years because it is the upper limit of the oldest 5-year age group in which no persons could have been married before 1890, the earliest year for which year at first marriage was recorded on the sample FOSDIC schedule.

In deriving age at first marriage, the year and quarter of the person's birth was subtracted from the year and quarter of the person's first marriage. Where the result of this subtraction included a fraction (e.g., age at marriage $2l\frac{1}{4}$, $2l\frac{1}{2}$, or $2l\frac{3}{4}$), the fraction was dropped, so as to express the result in completed years of age at first marriage. Where the result of the subtraction included no fraction, which was the case when the quarter of birth and first marriage were the same, the result was reduced by 1 year in approximately one-half the cases, namely, those in which the quarter was January to March or October to December. This adjustment was not made, however, where the result of the subtraction was 14 years.

The adjustment was made in order to eliminate the upward bias in the distribution by age at marriage that would otherwise have occurred. For example, the calculated difference between a birthdate of April-June 1925 and a marriage date of April-June 1950 is 25 years. However, on the assumption that births and marriages were evenly distributed throughout their respective quarters, only one-half of the persons with these dates were married after their 25th birthday, and one-half were married before their 25th birthday. Omission of the adjustment would have resulted in classifying about one-half of all persons who had the same quarter of birth and marriage in the next higher year of age at marriage than the one in which they were actually married. It is recognized that in age ranges where the marriage rate increases rapidly, as from 14 to 20 years of age, the adjustment resulted in some overstatement of the number of persons marrying at very young ages. However, the general effect of the adjustment was to increase the accuracy of the overall distribution by age at marriage and, especially, the median age at marriage.

For information on editing and allocation procedures for year of and age at first marriage, see the section below on "Editing."

Rate of first marriage .-- Average annual first marriages per 1,000 single persons 14 to 44 years old are shown, by age, in tables 16 to 18. The numerator of this rate is the average annual number of persons who first married at a given age in 1958 and 1959. The denominator is the average annual number of persons who were of that age and single on July 1, 1958 and 1959. This figure was obtained by averaging the number of persons who were of the given age and single on July 1, 1958, with the corresponding number for July 1, 1959. The number of single persons on July 1, 1958, is the sum of (1) persons who were single at the census date and (2) persons ever married at the census date who first married after July 1, 1958. The number of single persons on July 1, 1959, is defined in corresponding fashion, except with reference to July 1, 1959, instead of 1958. Persons who were 14 to 44 years old and single on both dates were counted twice--once in the column for their age on July 1, 1958, and once in the column for their age on July 1, 1959.

USES AND LIMITATIONS OF THE DATA

The statistics in this report make possible the study of the relationships between age at first marriage, on one hand, and marital stability, remarriage, and a variety of social characteristics, on the other. Furthermore, the data provide an opportunity for study of trends in age at first marriage in the entire population and in the various ethnic and racial groups that make it up. Detail by single years of first marriage and single years of age at first marriage makes possible the analysis of the effects of historical events on number and age distribution of first marriages. In addition, the data give information on geographic variations in age at first marriage.

In using the data in this report, it should be kept in mind that, in general, they refer to the characteristics of the population at the time of the enumeration. Thus, the data on residence, race, marital status, educational attainment, and occupation, refer to these characteristics as of 1960, and the data on income refer to income in 1959. Among these characteristics, race is fixed, and education does not change for most persons after age 25. However, residence, occupation, and income are changeable; consequently, the person's status with respect to these characteristics may differ from his status at the time of his first marriage, especially if he was married many years before the census. These differences in the time reference of the characteristics should be taken into account in interpreting the data.

The data shown in tables 3, 4 , and ^{4}a for the survivors enumerated in 1960 of marriage cohorts married many years ago are not strictly representative of

the age-at-marriage distribution of the original membership of the cohort. Because of the effect of higher mortality among older persons, those members of the cohort who were older at marriage are subject to higher mortality rates and are less likely to have survived than those who were younger at the time of marriage. After a number of years, the changes in the cohort become so large that the survivors are no longer representative of the original cohort. With the aid of life tables for the years between marriage and the enumeration date, the data for survivors can be supplemented by estimates of the persons who died between the date of marriage and the census date. Such a procedure was used for data shown in Current Population Reports, Series P-20, No. 108, "Marriage, Fertility, and Childspacing: August 1959," to estimate the distribution by age at first marriage for all women, including deceased, who first married between 1900 and 1959. In that report, for example, the median age at first marriage for white women who first married in 1900 to 1909 was 20.2 years based on data for survivors to 1959. However, when the data were supplemented by estimates for the women who died between the date of marriage and the date of the survey, the median age at first marriage was 21.2 years. For further information, see the section "Adjusted data for marriage cohorts" in the 1959 report.

QUALITY OF THE DATA

The quality of the data on age at first marriage may be judged from information on rates of allocation for nonresponse, that is, cases where the person failed to supply the necessary information or gave a response inconsistent with other information in the schedule. Because age at first marriage was derived from date of first marriage and date of birth, a nonresponse of either of these items caused a nonresponse on age at first marriage.

A person was classified as having an allocated age at first marriage if his year of first marriage or his year of birth or both were allocated. All persons with a nonresponse on date of first marriage were assigned a definite date, as explained below in the section on "Editing," and the relatively small number of persons with a nonresponse on date of birth were assigned a definite birthdate. However, only assignments of year of first marriage or birth were counted as allocations. Where only calendar quarter was missing, the assignment of this information was not counted as an allocation, and is not reflected in the data on allocated age at first marriage.

Age at first marriage was allocated for 6.6 percent of all ever-married males and for 7.0 percent of females. For nonwhites, the corresponding figures were 14.5 percent for males and 15.0 percent for females (table A).

Table A.--PERCENT WITH ALLOCATED AGE AT FIRST MARRIAGE, BY COLOR AND SEX: 1960

Color	Male	Female
Total	6.6	7.0
White	5.8	6.1
Nonwhite	14.5	15.0

About 94.7 percent of allocations for age at first marriage for men, and about 93.9 percent for women, were, in whole or in part, the result of allocations for nonresponse on data of first marriage (table B).

Table B.--PERCENT DISTRIBUTION BY COMPONENTS OF ALLOCATION, BY SEX: 1960

Subject	Male	Female
Total, persons with age at first marriage allocatedthousands	3,003	3,591
Percent	100.0	100.0
Date of first marriage allocated Date of birth also allocated Date of birth not allocated Date of first marriage not allocated, date of birth allocated	94.7 9.6 85,1 5.3	93.9 9.7 84.1 6.1

In general, allocations for nonresponse were relatively high among persons marrying at the younger and the older ages, and low for those marrying near the median age at first marriage. The categories in which marriage is rare, such as males 14 to 17 years old, have the highest allocation rates (table C).

Table C.--PERCENT WITH ALLOCATED AGE AT FIRST MARRIAGE, BY AGE AT FIRST MARRIAGE AND SEX: 1960

Age at first marriage	Male	Female
Total	6.6	7.0
14 to 17 years. 18 and 19 years. 20 to 24 years. 25 to 29 years. 30 to 34 years. 35 years and over.	22.5 6.7 5.0 5.8 7.5 11.0	9.4 5.0 6.0 8.7 8.0 9.6

Allocation rates for age at first marriage were lower for persons 25 to 44 years old at the time of the census than for younger or older persons (table D).

Table D.--PERCENT WITH ALLOCATED AGE AT FIRST MARRIAGE, BY AGE AT CENSUS AND SEX: 1960

Age at census	Male	Female
Total	6.6	<u></u>
14 to 24 years	9.4 5.4 5.8 6.7 7.5 7.8	8.1 5.6 6.2 7.2 7.9 8.5

Although rigid precautions were taken to record date of first marriage correctly, some inaccuracies due to failure of memory of older persons may have remained undetected. In addition, some enumerators may have failed to determine whether the person had been married more than once, or persons may have given incorrect answers to conceal births of illegitimate children or a previous marriage. The extent of allocations was not tabulated by year of first marriage. However, the differences between the distribution by age at first marriage for persons who first married in 1959 and 1960 and the distributions for persons first married in the immediately prior years, shown in table 3 of this report, suggest that the proportion of allocations may have been larger than average in the data for 1959 and 1960. This result could have been produced by the procedures used to allocate data for nonresponse. For further information on procedures for editing and allocation, see the section on "Editing," below.

COMPARABILITY

Earlier census data .-- The statistics published in reports of the 1940 Census under the general title Differential Fertility--1940 and 1910 included data on age at first marriage for women 15 to 74 years old for 1940. The published data on this subject were limited to women who were reported as married once with husband present, because relatively large proportions of the other ever-married women made no report on this subject. In the 1940 Census, women were asked their age at first marriage, whereas in the 1960 Census, age at first marriage was derived from answers to questions on birthdate and date of first marriage. About 4.4 percent of women who were married once with husband present did not respond to the question in the 1940 Census, as compared with the figure of 7.0 percent of ever-married women 14 to 79 years old for whom age at first marriage was allocated in the 1960 Census. Allocations for nonresponse were not made for the data on age at first marriage in 1940, but were made during the editing of the 1960 Census data. These differences between the 1940 and the 1960 Censuses with respect to the method of obtaining information on age at first marriage, the extent of nonresponse, and the method of dealing with nonresponses may have created some lack of comparability between the resulting statistics.

The statistics on duration of current marital status for women that were published in <u>1950 Census of</u> <u>Population</u>, Volume IV, Part 2, chapter E, <u>Duration of</u> <u>Current Marital Status</u>, included data on age at first marriage for women married once with husband present. For these women, information on number of years since first marriage was obtained from answers to the following question: "How many years since this person was married?" Age at first marriage was derived by subtracting the number of completed years since first marriage from the woman's age in completed years. For example, if a woman reported that she had been married for 3 years and that she was 23 years old at the time of the enumeration, she was classified as 20 years old at first marriage.

This basis of classification yields results that differ from the data on age at first marriage shown in the present report. If age in completed years at census is 23 years, the range of exact ages is 23.00 to 23.99 years; if the duration of marriage is 3 years, the range of exact duration is 3.00 to 3.99 years. The limits of the range of derived age at marriage are, therefore, 19.01 to 20.99 years and the midpoint for this interval is 20.00 years. Data in the present report were derived from information on calendar quarter and year of birth and marriage, rather than year alone. As a result, age 20 at first marriage in the present report has the more conventional meaning of 20.00 to 20.99 years, and the midpoint is one-half year higher than the midpoint of age 20 at first marriage in the 1950 Census data.

The median ages at first marriage shown in the 1950 Census data take account of the method by which age at first marriage was derived, and may be compared with corresponding medians in the present report. Comparability of the figures for any given age at marriage is impaired, however, for the reason set forth above and because the derivation of age at first marriage from information in completed years tends to produce a flatter distribution than would be produced if more detailed information on birthdate and date of first marriage were available. As indicated above, the women classified in each single year of age at marriage in the 1950 Census data were drawn from women whose true ages at marriage covered a range of 2 years. Consequently, the figures are subject to an averaging effect, whereby the true frequencies in each age at marriage are averaged with the frequencies for adjoining ages. The resulting distribution tends to understate the true frequencies in the most popular ages at marriage, and to overstate the others.

1960 Census data in other reports.--Data in this report are consistent with corresponding data in 1960 Census of Population, PC(2)-4E, Marital Status. There are some small differences between the statistics in these reports and the statistics on age at first marriage, year of first marriage, and years since first marriage in PC(2)-3A, Women by Number of Children Ever Born, and PC(2)-4A, Families. These differences are the result of a supplementary edit which was performed to correct faulty dates of first marriage for a relatively small number of persons. The supplementary edit was performed prior to tabulation of the data in this report and the report on Marital Status, but after tabulation of the other two reports.

Current Population Survey. -- Table E shows distributions by age at first marriage for white women who first married in 1900 to 1959, from the present report and from the August 1959 Current Population Survey (CPS), the results of which were published in Current Population Reports, Series P-20, No. 108. Some differences between the two sets of figures are to be expected because of differences in dates and coverage between the census and the CPS, and because of the sampling error associated with estimates based on the CPS. The CPS data were collected in August 1959, as compared with the April 1960 date of the census. The CPS survey was limited to the civilian noninstitutional population, whereas the census included military personnel and inmates of institutions; and the CPS did not include Alaska and Hawaii, which were included in the census. However, these differences do not account for differences in the figures for two'of the groups shown. The census shows significantly more women first married in 1930 to 1939 and significantly

fewer women first married in 1900 to 1909 than does the CPS. The latter difference is to be expected because this group has reached an advanced age, at which the effect of mortality during the 8-month period between the census and the survey would be substantial. However, the inclusion of inmates of institutions in the census, and their exclusion from the CPS, would have a compensating effect, tending to make the numbers of women first married in 1900 to 1909 in the census and the CPS more nearly equal than they are.

The explanation for both these differences appears to lie in differences between the age structure of the population enumerated in the 1960 Census and the age structure of the independent estimates used to inflate the sample data from the CPS in 1959. Thus, the census shows more women of an age to have been married for the first time in 1930 to 1939, and fewer women of an age to have been married for the first time in 1900 to 1909, than were shown in the independent population estimates used to inflate the CPS data.

The proportion of women who first married at 25 years of age and over is generally higher in the census data than in the CPS, and the proportion of women who first married under 22 years of age is correspondingly lower. In the figures for women first married before 1930, these differences produce differences of threeor four-tenths of a year in the median age at first marriage. The aforementioned differences between the census and the CPS cannot account for these differences in the figures; nor can the amount of editing, which was similar. In the census, about 6 percent of the white women had a date of first marriage that was allocated for nonresponse and inconsistency. In the CPS, an estimated 5 percent of the white women had a blank decade or year of first marriage, and an additional 1.4 percent had a reported date of first marriage that yielded a derived age under 14 years at first marriage prior to editing.

In the CPS, a manual edit was performed in which women with blank dates of first marriage were assigned a date of marriage in accordance with distributions, based on the 1950 Census, which took into account date of birth of the first child, where available. The relatively small number of white women whose reported date of first marriage yielded a derived age under 14 years in the tabulations were distributed pro rata among ages 14 years and over at first marriage. Differences between those procedures and the 1960 Census procedures described in the section on "Editing," below, might give rise to some differences in the resulting statistics. However, given the relatively small proportion of persons requiring allocation, it is unlikely that differences in editing procedure could produce differences of the size shown for some cohorts in table E.

In the CPS, the question on date of first marriage was asked at the end of the interview, following a series of questions on the dates of birth of the woman's children. This sequence may have led some women to give a marriage date earlier than they might otherwise have given. In the 1960 Census, date of first marriage was asked in the self-administered Household Questionnaire; this did not include the question on birthdates of children, which had been reported previously in the Advance Census Report. Table F shows comparisons by color for women who first married in 1950 to 1959. Most of the difference between the CPS and the census with respect to the percent of nonwhite women who first married at l^4 to 17 years of age is attributable to differences in the handling of ages under l^4 years at first marriage. Whereas white women in the CPS with a reported age under l^4 years at first marriage were distributed among all ages l^4 years and over at first marriage, among nonwhites the number of women with a reported marriage age under l^4 was so large that these cases were assumed to reflect chiefly early marriages and, therefore, were combined with data for the group married at age 14 to 17.

<u>Vital Statistics</u>.--Table G shows comparisons of the average annual number of persons first married at ages 14 to 44 years in 1958 and 1959 for 26 States from table 18 of this report with the corresponding figures based on registered marriages, published in <u>Vital Statistics of the United States</u> for 1958 and 1959. The 26 States are those for which the number of

¹ Census includes women who first married in January to March 1960; CPS excludes women who first married in September to December 1959.

registered first marriages by age and sex was available for the entire State in 1958 and 1959. The differences shown between the census and vital statistics with respect to total number of first marriages are relatively small. Such differences as there are may be attributable to the fact that in the vital statistics, marriages were classified by the State in which they occurred, whereas in the census, persons who first married in 1958 and 1959 were classified by their State of residence in 1960. Thus, differences in the number of marriages from the two sources may appear because some persons married in States other than their State of residence in 1960, and because some persons changed their residence from one State to another between marriage and the date of the enumeration. Furthermore. differences in reporting of date of first marriage or age could result in the inclusion of a person in the census figures and his exclusion from registered marriages, and vice versa.

The census data show somewhat fewer first marriages at ages 20 to 24 than are shown by the registration data, and more first marriages above and below these ages. These differences may arise from the differences noted above or from a variety of other sources, including the approximations required in order to derive some ages at first marriage (see section on "Age at first marriage," above), and the fact that age at first marriage was allocated for 7 percent of persons in the census data, whereas the registration data included a negligible proportion of persons with a nonresponse on age at first marriage.

Table G.--COMPARISON OF 1960 CENSUS DATA ON AVERAGE ANNUAL FIRST MARRIAGES AT AGES 14 TO 44 YEARS IN 1958 AND 1959 WITH DATA BASED ON REGISTERED MARRIAGES, BY AGE AND SEX, FOR 26 STATES

MEDIAN

The median is presented in connection with the data on age at first marriage, years of school completed, and income. It is the value which divides the distribution into two equal parts, one-half the cases falling below this value and one-half the cases exceeding this value.

A plus (+) or minus (-) sign after the median indicates that the median is above or below that number. For example, a median of \$10,000+ for income indicates that the median fell in the interval "\$10,000 or more."

MEAN

The figure for mean earnings shown in table 14 is the number obtained by dividing the total earnings of a group by the number of persons in that group. The mean age at first marriage for persons in each of the groups shown in tables 4a, 9a, 11a, and 13a was obtained by dividing the sum of all ages at first marriage by the total number of persons in each group, and adding 0.5 years to the result. This last step took account of the fact that, on the average, persons are one-half year older at marriage than their age at marriage in completed years. For instance, persons who had completed 22 years of age when they were married were 22.5 years old at marriage, on the average.

URBAN-RURAL RESIDENCE

In general, the urban population comprises all persons living in urbanized areas and in places of 2,500 inhabitants or more outside urbanized areas. More specifically, according to the definition adopted for use in the 1960 Census, the urban population comprises all persons living in (a) places of 2,500 inhabitants or more incorporated as cities, boroughs, villages, and towns (except towns in New England, New York, and Wisconsin); (b) the densely settled urban fringe, whether incorporated or unincorporated, of urbanized areas; (c) towns in New England and townships in New Jersey and Pennsylvania which contain no incorporated municipalities as subdivisions and have either 25,000 inhabitants or more or a population of 2,500 to 25,000 and a density of 1,500 persons or more per square mile; (d) counties in States other than the New England States, New Jersey, and Pennsylvania that have no incorporated municipalities within their boundaries and have a density of 1,500 persons or more per square mile; and (e) unincorporated places of 2,500 inhabitants or more. The population not classified as urban constitutes the rural population.

FARM-NONFARM RESIDENCE

The rural population is subdivided into the ruralfarm population, which comprises all rural residents living on farms, and the rural-nonfarm population, which comprises the remaining rural population. In the 1960 Census, the farm population consists of persons living in rural territory on places of 10 or more acres from which sales of farm products amounted to \$50 or more in 1959 or on places of less than 10 acres from which sales of farm products amounted to \$250 or more in 1959. All persons living in group quarters are classified as nonfarm except the relatively few living in workers' quarters (including quarters for migratory agricultural workers) that are located on a farm or ranch.

URBANIZED AREA

An urbanized area contains at least one city of 50,000 inhabitants or more in 1960 and the surrounding closely settled incorporated places and unincorporated areas that meet certain criteria relating to population density or land use. An urbanized area may be thought of as divided into the central city, or cities, and the remainder of the area, or the urban fringe. All persons residing in an urbanized area are included in the urban population.

AGE

The age classification is based on the age of the person in completed years as of April 1, 1960, as determined from the reply to a question on month and year of birth. In tables 16 to 18, however, the age classification is based on the age of the person as of July 1, 1958 and 1959.

RACE AND COLOR

The term "color" refers to the division of population into two groups, white and nonwhite. The color group designated as "nonwhite" consists of such races as the Negro, American Indian, Japanese, Chinese, Filipino, Korean, Hawajian, Asian Indian, Eskimo, Aleut, and Malayan races. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white.

<u>Negro</u>.--In addition to persons of Negro and of mixed Negro and white descent, this classification includes persons of mixed Indian and Negro descent, unless the Indian ancestry predominates or unless the individual is regarded as an Indian in the community.

<u>American Indian</u>.--In addition to fullblooded Indians, persons of mixed white and Indian blood are included if the proportion of Indian blood is one-fourth or more, or if they are regarded as Indian in the community.

Other races.--Separate statistics are given in this report for Japanese, Chinese, and Filipinos. The category "Other races" includes Koreans, Hawaiians, Asian Indians, Eskimos, Aleuts, Malayans, etc.

<u>Mixed parentage</u>.--Persons of mixed racial parentage are classified according to the race of the nonwhite parent, and mixtures of nonwhite races are classified according to the race of the father, with the special exceptions noted above.

NATIVITY AND PARENTAGE

<u>Native</u>.--Comprises persons born in the United States, the Commonwealth of Puerto Rico, or a possession of the United States; persons born in a foreign country or at sea who have at least one native American parent; and persons whose place of birth was not reported and whose census report contained no contradictory information, such as an entry of a language spoken prior to coming to the United States. Foreign born.--Includes all persons not classified as native.

<u>Native of native parentage</u>.--Consists of native persons both of whose parents are also natives of the United States.

<u>Native of foreign or mixed parentage.--Includes</u> native persons one or both of whose parents are foreign born.

Foreign stock .-- Includes foreign-born persons and native persons of foreign or mixed parentage.

COUNTRY OF ORIGIN OF THE FOREIGN STOCK

Persons of foreign stock are classified according to their country of origin--country of birth for the foreign born and parents' country of birth for the native of foreign or mixed parentage. Natives of foreign parentage whose parents were born in different countries are classified according to the country of birth of the father. Natives of mixed parentage are classified according to the country of birth of the foreign-born parent. The classification by country of origin is based on international boundaries as recognized by the U.S. Government on April 1, 1960, although there may have been some deviation from the rules where respondents were unaware of changes in boundaries or jurisdiction.

PERSONS OF SPANISH SURNAME

In order to obtain data on Spanish- and Mexican-Americans for areas of the United States where most of them live, white persons (and white heads of households) of Spanish surname were distinguished separately in five Southwestern States (Arizona, California, Colorado, New Mexico, and Texas).

PUERTO RICANS

Puerto Ricans comprise persons born in Puerto Rico and persons born in the United States or its possessions with one or both parents born in Puerto Rico.

YEARS OF SCHOOL COMPLETED

The data on years of school completed were derived from the answers to the two questions: (a) "What is the highest grade (or year) of regular school he has ever attended?" and (b) "Did he finish this grade (or year)?" Enumerators were instructed to obtain the approximate equivalent grade in the American school system for persons whose highest grade of attendance was in a foreign school system, whose highest level of attendance was in an ungraded school, whose highest level of schooling was measured by "readers," or whose training by a tutor was regarded as qualifying under the "regular" school definition. Persons were to answer "No" to the second question if they were attending school, had completed only part of a grade before they dropped out, or failed to pass the last grade attended.

The number in each category of highest grade of school completed represents the combination of (a) persons who reported that they had attended the indicated grade and finished it, and (b) those who had attended the next higher grade but had not finished it.

COLLEGE ENROLLMENT

College enrollment is shown in table 15 for married men with wife present, who are not heads of households. Persons were included as enrolled in college if they were reported as attending or enrolled in a "regular" college at any time between February 1, 1960. and the time of the enumeration. Schooling in a "regular" college is that which may advance a person toward a college, university, or professional degree. Schooling that was not obtained in a regular college and schooling from a tutor or through correspondence courses were counted only if the credits obtained were transferable to a regular college. Schooling which is generally regarded as not regular includes that which is given in specialized trade, vocational, or business schools; in on-the-job training; and in correspondence courses. College includes junior or community colleges, regular 4-year colleges, and graduate or professional schools.

MARITAL STATUS

This classification refers to the marital status of the person at the time of enumeration. Persons classified as "married" comprise, therefore, both those who have been married only once and those who remarried after having been widowed or divorced. Persons reported as separated (either legally separated or otherwise absent from the spouse because of marital discord) are classified as a subcategory of married persons. The enumerators were instructed to report persons in common-law marriages as married and persons whose only marriage had been annulled as single. Persons "ever married" are those in the categories married (including separated), widowed, and divorced.

The number of married men may be different from the number of married women for an area because of the absence of husbands or wives from the country, because the husband and wife have different places of residence, because of the methods used to inflate the sample data, or for other reasons.

A married person with "spouse present" is a man or woman whose spouse was enumerated as a member of the same household even though he or she may have been temporarily absent on business or vacation, visiting, in a hospital, etc., at the time of enumeration.

Persons whose first marriage was not intact, shown in table 10, include all widowed, separated, and divorced persons, and married persons (other than separated) who had been married more than once. Persons with first marriage intact include, therefore, persons in the marrial status classes "Married, spouse present, married once," and "Married, spouse absent (other than separated), married once."

MARRIED COUPLES

A married couple is a husband and his wife enumerated as members of the same household. The couple may or may not have children living with them. Married couples without own household shown in table 15 are couples in which the husband is not the head of the household.

HOUSEHOLD AND RELATIONSHIP TO HEAD OF HOUSEHOLD

<u>Household</u>.--A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants. A household includes the related family members and also the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit.

<u>Relationship</u> to head of household.--For married couples without own household, four categories of relationship of the husband to the head of the household are recognized in this report.

1. A son of the head is a child, stepchild, or adopted child of the head.

2. A <u>son-in-law</u> is the husband of the head's daughter, stepdaughter, or adopted daughter.

3. An <u>other relative</u> of the head is a man related to the head of the household by blood, marriage, or adoption, but not the head's own son or son-in-law.

4. A <u>nonrelative</u> of the head is any member of the household who is not related to the household head. This category includes lodgers (roomers and partners, relatives of such persons, and foster children) and resident employees (maids, hired farm hands, etc.).

EMPLOYMENT STATUS

The data on employment status relate to the calendar week prior to the date on which the respondents filled their Household Questionnaires or were interviewed by enumerators. This week is not the same for all respondents because not all persons were enumerated during the same week.

Employed persons comprise all civilians 14 years old and over who were either (a) "at work"--those who did any work for pay or profit, or worked without pay for 15 hours or more on a family farm or in a family business; or (b) were "with a job but not at work"--those who did not work and were not looking for work but had a job or business from which they were temporarily absent because of bad weather, industrial dispute, vacation, illness, or other personal reasons.

XVIII

Persons are classified as unemployed if they were 14 years old and over and not "at work" but looking for work. A person is considered as looking for work not only if he actually tried to find work but also if he had made such efforts recently (i.e., within the past 60 days) and was awaiting the results of these efforts. Persons waiting to be called back to a job from which they had been laid off or furloughed are also counted as unemployed.

The "civilian labor force" includes all persons classified as employed or unemployed, as described above. The "labor force" also includes members of the Armed Forces (persons on active duty with the U.S. Army, Air Force, Navy, Marine Corps, or Coast Guard).

OCCUPATION

The data on occupation in this report are for employed persons and refer to the job held during the week for which employment status was reported. For persons employed at two or more jobs, the data refer to the job at which the person worked the greatest number of hours. The occupation statistics presented here are based on the detailed systems developed for the 1960 Census; see <u>1960 Census of Population</u>, <u>Clas-</u> <u>sified Index of Occupations and Industries</u>, U.S. Government Printing Office, Washington, D.C., 1960.

INCOME IN 1959

Information on income for the calendar year 1959 was requested from all persons 14 years old and over in the sample. "Total income" is the sum of amounts reported separately for wage or salary income, selfemployment income, and other income. Wage or salary income is defined as the total money earnings received for work performed as an employee. It represents the amount received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or professional enterprise in which the person was engaged on his own account. Earnings are obtained by summing wage or salary income and selfemployment income. Other income includes money income received from such sources as net rents, interest, dividends, Social Security benefits, pensions, veter, ans' payments, unemployment insurance, and public assistance or other governmental payments, and periodic receipts from insurance policies or annuities. Not included as income are money received from the sale of property (unless the recipient was engaged in the business of selling such property), the value of income "in kind," withdrawals of bank deposits, money borrowed, tax refunds, and gifts and lump-sum inheritances or insurance payments.

COLLECTION AND PROCESSING OF DATA

COLLECTION OF DATA

Several enumeration forms were used to collect the information for the 1960 Gensus of Population. A few days before the census date, the Post Office Department delivered an Advance Census Report (ACR) to households on postal delivery routes. This form contained questions which were to be answered for every person and every housing unit. Household members were requested to fill the ACR and have it ready for the enumerator. The census enumerator recorded this information on a form specially designed for electronic data processing by FOSDIC (Film Optical Sensing Device for Input to Computer). The information was either transcribed from the ACR to the complete-count FOSDIC schedule or entered on this schedule during direct interview.

In the densely populated areas, the enumerator left a Household Questionnaire to be completed by each household (or person) in the sample and mailed to the local census office. The population and housing information was transcribed from the Household Questionnaire to a sample FOSDIC schedule. When the Household Questionnaire was not returned or was returned without having been completed, the enumerator collected the missing information by personal visit or by telephone and entered it directly on the sample FOSDIC schedule. In the remaining areas, when the enumerator picked up the ACR, he obtained all the information by direct interview and recorded it directly on the sample FOSDIC schedule.

Soon after the enumerator started work, his schedules were examined in a formal field review. This operation was designed to assure at an early stage of the work that the enumerator was performing his duties properly and had corrected any errors he had made.

More detailed descriptions of the 1960 Census procedures in the collection and processing of the data are given in reports entitled <u>United States Cen-</u> suses of Population and Housing, 1960: Principal Data Collection Forms and Procedures, 1961; and <u>Processing</u> <u>the Data</u>, 1962, U.S. Government Printing Office, Washington, D.C., 20402.

MANUAL EDITING AND CODING

After the FOSDIC forms had been checked for completeness in the field, they were sent to a central processing office for manual editing and coding and for microfilming. Except where some special problems arose, there was no manual coding of the FOSDIC forms for complete-count data. On the sample forms, the manual operation was limited to those items where coding required the reading of written entries and therefore could not be done effectively by machine. The coding clerks converted the written entries to codes by marking the appropriate circles on the FOSDIC schedules and at the same time were able to correct obviously wrong entries and sometimes supply missing information.

ELECTRONIC PROCESSING

After the enumerators and coders recorded the information by marking the appropriate circles, the schedules were microfilmed. The information on the microfilm was then read by FOSDIC, which converted the markings to signals on magnetic tape. The tape, in turn, was processed in an electronic computer, which was used extensively to edit and tabulate the data and to produce the publication tables.

EDITING

For a majority of items, nonresponses and inconsistencies were eliminated by using the computer to assign entries and correct inconsistencies. In general, few assignments or corrections were required, although the amount varied by subject and by enumerator.

The assignment of an acceptable entry by machine was based on related information reported for the person or on information reported for a similar person in the immediate neighborhood. For example, in the assignment of age in the complete-count tabulations, the computer stored reported ages of persons by sex, color or race, household relationship, and marital status; each stored age was retained in the computer only until a succeeding person having the same characteristics and having age reported was processed through the computer; this stored age was assigned to the next person whose age was unknown and who otherwise had the same characteristics. This procedure insured that the distribution of ages assigned by the computer for persons of a given set of characteristics would correspond closely to the reported age distribution of such persons as obtained in the current census.

The extent of the allocations for nonresponse and inconsistency for most characteristics is shown for the United States in <u>1960 Census of Population</u>, Volume I, <u>Characteristics</u> of the <u>Population</u>, Part I, <u>United</u> <u>States Summary</u>, tables B-1, C-2, and D-1.

Specific tolerances were established for the number of computer allocations acceptable for a given area. If the number was beyond tolerance, the data were rejected and the original schedules were reexamined to determine the source of the error. Correction and reprocessing were undertaken as necessary and feasible.

Date of first marriage .-- The information on date of first marriage was transferred from the microfilmed stage II FOSDIC schedule to the computer tape without prior manual editing. No manual coding was necessary because the information was precoded on the schedules. A computer edit was used to eliminate inconsistencies and to allocate blanks. There were three consistency checks. In the first check, the computer inspected the entries for each ever-married person to insure that the recorded date of first marriage was at least 14 years later than the person's date of birth and that it was not later than March 1960. All dates of marriage failing to meet this requirement were treated as if they were blank. The other two consistency checks related only to married couples. First, if each partner had been married only once, the dates of first marriage had to be the same. If they were not, the earlier of the two dates was changed to agree with

the later one. Second, the date of first marriage for a spouse married more than once had to be earlier than the date of first marriage for a spouse married only once. If it was not, the date of first marriage for the person married more than once was treated as if it were blank.

The procedure for allocating date of first marriage when the person and his spouse had been married only once was to assign to the person the date of first marriage of the spouse. For the remaining allocations, three matrices were used. One matrix was used to allocate date of first marriage for married persons, spouse present, where one partner was married once and the other more than once, and where the spouse's date of first marriage was known. In this matrix the difference in years between the dates of first marriages of previously recorded spouses was stored in 10 cells according to the age of the husband. If the person was married more than once, his date of first marriage was obtained by subtracting this difference from the spouse's marriage date. If the person had been married only once, a date of marriage was obtained for him by adding this difference to the spouse's date of first marriage.

A second matrix, of six cells, was used to allocate the date of first marriage of ever-married women 14 to 44 years old with one or more children in the household. The difference between the number of years a previously recorded woman in this category had been married and the age of her oldest child was stored in this matrix according to the woman's own age. When a date of first marriage was missing, the last stored value was subtracted from the date of birth of the woman's oldest child to obtain a date of first marriage to allocate. If the woman was married, husband present, and the date of the husband's first marriage was also unknown, and if both husband and wife had been married only once, the husband was assigned the same date.

A third matrix of 104 cells was used to allocate date of first marriage for all other persons. The number of years married was stored by age, sex, and whether married more than once. The last stored value was subtracted from 1960 to obtain a date to allocate for the person's year of first marriage. The quarter of the year in which the marriage occurred was then assigned by random allocation. If the person was a married woman whose husband's date of first marriage was also unknown, and if both she and her husband had been married only once, her husband was assigned the same date.

It would have been possible under this system for the allocated date of first marriage to be inconsistent with the person's age or the date of the census, i.e., either less than 14 years later than the person's date of birth or later than March 1960. The principal means used to eliminate the first type of inconsistent allocation was to advance the date of first marriage beyond the date of the person's fourteenth birthday by the amount that the date originally allocated was less than the date of the person's fourteenth birthday; where this yielded a date later than March 1960, a date of first marriage of January to March 1960 was assigned. The principal means used to eliminate the second type of inconsistent allocation was to subtract from January-March 1960 the amount by which the originally allocated date of first marriage was later than January-March 1960.

Despite the precautions taken to eliminate unacceptable dates of first marriage, a relatively small number remained after the edits described above. These were reallocated before tabulation of the data in the present report and those in report PC(2)-4E, Marital Status. Dates of first marriage were reallocated for about 316,000 persons, or three-tenths of one percent of all persons ever married. The persons with date of first marriage reallocated are included in the total number of persons with an allocated date of first marriage shown in tables A to D and in appendix tables A-1 to A-3, and constitute about 4.8 percent of that total. Because these reallocations were made after tabulation of data for reports PC(2)-3A, Women by Number of Children Ever Born, and PC(2)-4A, Families, there are some minor differences between the statistics in those reports and the statistics in the present report and in PC(2)-4E, Marital Status.

The extent of allocation for nonresponse on date of first marriage is described in the section on "Quality of the data," above. The figures shown there do not include the 0.2 percent of the population for whom data were replicated because there were no sample data for them; for these persons, the characteristics shown are those for persons in the substitute households.

ACCURACY OF THE DATA

Human and mechanical errors occur in any mass statistical operation such as a decennial census. Such errors include failure to obtain required information from respondents, obtaining inconsistent information, recording information in the wrong place or incorrectly, or otherwise producing inconsistencies between entries on interrelated items on the field documents, Sampling biases occur because some of the enumerators fail to follow the sampling instructions. Clerical coding and editing errors occur, as well as errors in the electronic processing operation.

Careful efforts are made in every census to keep the errors in each step at an acceptably low level. Review of the enumerator's work, verification of manual coding and editing, checking of tabulated figures, and ratio estimation of sample data to control totals from the complete count reduce the effects of the errors in the census data.

Very minor differences between tables in this report or between corresponding data in this report and PC(2)-4E, <u>Marital Status</u>, and other reports based on the 5-percent sample, result from imperfections in the electronic equipment. No attempt has been made to reconcile these minor discrepancies.

Some innovations in the 1960 Censuses reduced errors in processing and others produced a more consistent quality of editing. The elimination of the card-punching operation removed one important source of error. The extensive use of electronic equipment insured a more uniform and more flexible edit than could have been accomplished manually or by less intricate mechanical equipment. It is believed that the use of electronic equipment in the 1960 Censuses has improved the quality of the editing compared with that of earlier censuses but, at the same time, it has introduced an element of difference in the statistics.

A group of reports designated <u>Evaluation and Re-</u> search Program of the U.S. Censuses of Population and <u>Housing, 1960</u>, deals with the methods, results, and interpretation of a group of evaluation and research studies of the 1960 Censuses of Population and Housing. A report entitled <u>The Post-Enumeration Survey: 1950</u>, Technical Paper No. 4, presents evaluative material on the 1950 Census.

SAMPLE DESIGN AND SAMPLING VARIABILITY

SAMPLE DESIGN

For persons in housing units at the time of the 1960 Census, the sampling unit was the housing unit and all its occupants; for persons in group quarters, it was the person. On the first visit to an address, the enumerator assigned a Sample Key Letter (A. B. C. or D) to each housing unit sequentially in the order in which he first visited the units, whether or not he completed an interview. Each enumerator was given a random key letter to start his assignment, and the order of canvassing was indicated in advance, although these instructions allowed some latitude in the order of visiting addresses. Each housing unit to which the key letter "A" was assigned was designated as a sample unit, and all persons enumerated in the unit were included in the sample. In every group quarters, the sample consisted of every fourth person in the order listed. The 1960 statistics in this report are based on a subsample of one-fifth of the original 25-percent sample schedules. The subsample was selected on the computer, using a stratified systematic sample design. The strata were made up as follows: for persons in regular housing units there were 36 strata, i.e., 9 household size groups by 2 tenure groups by 2 color groups; for persons in group quarters, there were 2 strata, i.e., the 2 color groups.

Although the sampling procedure did not automatically insure an exact 5-percent sample of persons, the sample design was unbiased if carried through according to instructions. Generally, for large areas, the deviation from the estimated sample size was found to be quite small. Biases may have arisen, however, when the enumerator failed to follow his listing and sampling instructions exactly.

RATIO ESTIMATION

The statistics based on the 5-percent sample of the 1960 Census returns are estimates that have been developed through the use of a ratio estimation procedure. This procedure was carried out for each of the following 44 groups of persons in each of the sample weighting areas:¹

Group	Sex, color, and_age	Relationship and tenure	
1 2 3 4 5 6-8 9-11	Male white: Under 5 5 to 13 14 to 24 14 to 24 14 to 24 25 to 44 45 and over	Head of owner household Head of renter household Not head of household Same groups as age group Same groups as age group	14 to 24
12 - 22	Male nonwhite: Same groups	as male white	
23-33	Female white: Same groups	as male white	

Female nonwhite: 34-44 Same groups as male white

The sample weighting areas were defined as those within a State consisting of central cities of urbanized areas, the remaining portion of urbanized areas not in central cities, urban places not in urbanized areas, or rural areas.

For each of the 44 groups, the ratio of the complete count to the sample count of the population in the group was determined. Each specific sample person in the group was assigned an integral weight so that the sum of the weights would equal the complete count for the group. For example, if the ratio for a group was 20.1, one-tenth of the persons (selected at random) within the group were assigned a weight of 21, and the remaining nine-tenths a weight of 20. The use of such a combination of integral weights rather than a single fractional weight was adopted to avoid the complications involved in rounding in the final tables. In order to increase the reliability, where there were fewer than 275 persons in the complete count in a group, or where the resulting weight was over 80, groups were combined in a specific order to satisfy both of these two conditions.

These ratio estimates reduce the component of sampling error arising from the variation in the size of household and achieve some of the gains of stratification in the selection of the sample, with the strata being the groups for which separate ratio estimates

¹ Estimates of characteristics from the sample for a given area are produced using the formula:

	44		
x'=	5		Xi Yi
	4	/	У <u>1</u> –
	1=1		

where x' is the estimate of the characteristic for the area obtained through the use of the ratio estimation procedure, xi is the count of sample persons with the characteristic for the area in one (i) of the 44 groups,

- yi is the count of all sample persons for the area in the same one of the 44 groups, and Yi is the count of persons in the complete count for the
- Yi is the count of persons in the complearea in the same one of the 44 groups.

are computed. The net effect is a reduction in the sampling error and bias of most statistics below what would be obtained by weighting the results of the 5percent sample by a uniform factor of twenty. The reduction in sampling error will be trivial for some items and substantial for others. A byproduct of this estimation procedure, in general, is that estimates for this sample are generally consistent with the complete count with respect to the total population and for the subdivisions used as groups in the estimation procedure. A more complete discussion of the technical aspects of these ratio estimates is presented in 1960 Censuses of Population and Housing: Procedural History, 1966.

SAMPLING VARIABILITY

The figures from the 5-percent sample tabulations are subject to sampling variability, which can be estimated roughly from the standard errors shown in tables H and J below.

Table H .-- ROUGH APPROXIMATION TO STANDARD ERROR OF ESTIMATED NUMBER

(Range of 2 chances out of 3)

Estimated	Standard	Estimated	Standard
number	error	number	error
50 250 500 1,000 2,500	40 - 60 90 120	5,000. 10,000. 15,000. 25,000. 50,000.	

Table J .-- ROUGH APPROXIMATION TO STANDARD ERROR OF ESTIMATED PERCENTAGE

⁽Range of 2 chances out of 3)

Estimated	Base of percentage										
percentage	500	1,000	2,500	10,000	25,000	100,000					
2 or 98 5 or 95 10 or 90 25 or 75 50	3.3 5.0 7.0 10.0 11.0	2.3 4.0 5.0 6.8 7.8	1.3 2.3 3.0 3.8 4.0	0.8 1.0 1.5 1.8 2.0	0.3 0.5 0.8 1.0 1.3	0.3 0.3 0.5 0.5					

These tables² do not reflect the effect of response variance, processing variance, or bias arising in the collection, processing, and estimation steps. Estimates of the magnitude of some of these factors in the total error are being evaluated and will be published at a later date. The chances are about two out of three that the difference due to sampling variability between an estimate and the figure that would have been obtained from a complete count of the population is less than the standard error. The chances are about 19 out of 20 that the difference is less . than twice the standard error and about 99 out of 100 that it is less than $2\frac{1}{2}$ times the standard error. The

² The estimates of sampling variability are based on partial information on variances calculated from a sample of the 1960 Census results.

amount by which the estimated standard error must be multiplied to obtain other odds deemed more appropriate can be found in most statistical textbooks.

Table H shows rough standard errors of estimated numbers up to 50,000. The relative sampling errors of larger estimated numbers are somewhat smaller than for 50,000. For estimated numbers above 50,000, however, the nonsampling errors, e.g., response errors and processing errors, may have an increasingly important effect on the total error. Table J shows rough standard errors of data in the form of percentages. Linear interpolation in tables H and J will provide approximate results that are satisfactory for most purposes.

For a discussion of the sampling variability of medians and means and of the method for obtaining

standard errors of differences between two estimates, see <u>1960 Census of Population</u>, Volume I, <u>Characteris</u>tics of the Population, Part 1, United States Summary.

Illustration: Table 15 shows that there were 35,800 men married 1 year who were sons of the household head and married with wife present. Linear interpolation in table H shows that an approximation to the standard error for an estimate of 35,800 is 732. This means that the chances are 2 out of 3 that the results of a complete count of all men married 1 year who were sons of the household head and married with wife present, would not differ by more than 732 from a sample estimate. Furthermore, the chances are about 99 in 100 that the difference is less than 1,830 which is $2\frac{1}{2}$ times the standard error determined from table H.
