PER CAPITA AND MEDIAN FAMILY MONEY INCOME IN 1959, FOR STATES, STANDARD METROPOLITAN STATISTICAL AREAS, AND COUNTIES

This report presents per capita and median family money incomes in 1959 for States, standard metropolitan statistical areas (SMSA's), and counties ranked in ascending order, from the lowest to the highest money income levels. The data are presented in four tables--table 1 shows data for the United States by State; table 2 shows data for standard metropolitan statistical areas; and tables 3 and 4 show data for counties.

The per capita money income figures contained in this report were derived from data published in: 1960 Census of Population, Volume I, Characteristics of the Population, chap-

ter C, Parts 2 through 52. Median family money incomes have been published in these census publications.

Of the 50 States and the District of Columbia, Mississippi ranked lowest in both per capita (\$967) and median family income (\$2,884). Nevada was the highest ranking State in per capita income (\$2,356), whereas Alaska ranked highest in median family income (\$7,305). The per capita income in the District of Columbia was higher than that of any State (\$2,404). Of the 212 standard metropolitan statistical areas, the Stamford, Conn., SMSA ranked highest in both per capita (\$3,785) and median family

Table A.--PER CAPITA INCOME RANGE IN 1959, FOR EACH DECILE OF COUNTIES
(Population as of 1960. Decile based on ascending order, from lowest to highest income)

| County decile | Number of counties | Per capita income range | | Population | |
|---------------------------------|--------------------|-------------------------|---------|-------------|---------|
| | | From | To | Number | Percent |
| All counties ¹ | 3,132 | \$424 | \$3,541 | 179,323,125 | 100.0 |
| Lowest decile..... | 313 | 424 | 828 | 4,692,729 | 2.6 |
| Second decile..... | 313 | 828 | 975 | 5,616,615 | 3.1 |
| Third decile..... | 313 | 975 | 1,123 | 5,733,861 | 3.2 |
| Fourth decile..... | 313 | 1,123 | 1,243 | 6,455,851 | 3.6 |
| Fifth decile..... | 313 | 1,243 | 1,344 | 6,596,088 | 3.7 |
| Sixth decile..... | 313 | 1,344 | 1,445 | 7,719,033 | 4.3 |
| Seventh decile..... | 313 | 1,445 | 1,565 | 11,914,885 | 6.6 |
| Eighth decile..... | 313 | 1,565 | 1,707 | 15,050,448 | 8.4 |
| Ninth decile..... | 313 | 1,707 | 1,887 | 27,072,457 | 15.1 |
| Highest decile..... | 315 | 1,887 | 3,541 | 88,473,707 | 49.3 |

¹ Excludes two counties with a population of 50 persons for which per capita income was not available. This accounts for the difference in the total population in tables A and B.

U.S. DEPARTMENT OF COMMERCE, John T. Connor, *Secretary*
BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C. 20233, and U.S. Department of Commerce Field Offices, 75 cents.

money income (\$8,745). The Laredo, Tex., SMSA ranked lowest in both per capita (\$937) and median family income (\$2,952).

As shown in table A, there was considerable difference in the proportion of the population residing in counties with per capita incomes in the lowest decile (between \$424 and \$828), and the proportion residing in counties with per capita income in the highest decile (between \$1,887 and \$3,541). Counties in the lowest decile (tenth) group contained only about 3 percent of the total population, where-

as counties in the highest decile group contained 49 percent. It is interesting to note (table B) that the 10 counties with the lowest per capita incomes (between \$424 and \$505) contained only 0.05 percent of the U.S. population, whereas the 10 counties with the highest per capita incomes (between \$2,853 and \$3,541) contained 2.74 percent of the total population. These differences are the natural result of the fact that the lowest ranking counties are characteristically small rural counties, whereas the highest ranking are populous metropolitan counties.

Table B.--PER CAPITA INCOME IN 1959, FOR ALL COUNTIES AND FOR THE 10 LOWEST, MIDDLE, AND HIGHEST RANKING COUNTIES
(Population as of 1960. Rank based on ascending order, from lowest to highest income)

| County | Population | | | Per capita income | Aggregate income | |

DEFINITIONS AND EXPLANATIONS

Income in 1959.--Information on income for the calendar year 1959 was requested from all persons 14 years old and over in the sample. "Total income" is the sum of amounts reported separately for wage or salary income, self-employment income, and other income. Wage or salary income is defined as the total money earnings received for work performed as an employee. It represents the amount received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or professional enterprise in which the person was engaged on his own account. Other income includes money income received from such sources as net rents, interest, dividends, Social Security benefits, pensions, veterans' payments, unemployment insurance, and public assistance or other governmental payments, and periodic receipts from insurance policies or annuities. Not included as income are money received from the sale of property (unless the recipient was engaged in the business of selling such property), the value of income "in kind," withdrawals of bank deposits, money borrowed, tax refunds, and gifts and lump-sum inheritances or insurance payments.

In the statistics on family income, the combined incomes of all members of each family are treated as a single amount. Although the time period covered by the income statistics is the calendar year 1959, the composition of families refers to the time of enumeration. For most of the families, however, the income reported was received by persons who were members of the family throughout 1959.

Median income.--The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Per capita income.--This is the average amount of income available for every man, woman, and child in an area. Per capita income is derived by dividing the total income of an area by the population in the same area.

Limitations of the data.--The schedule entries for income are frequently based not on records but on memory, and this factor probably

produces underestimates, because the tendency is to forget minor or irregular sources of income. Other errors of reporting are due to misunderstanding of the income questions or to misrepresentation.

The income data in this report cover money income only. The fact that many farm families receive an important part of their income in the form of rent-free housing and of goods produced and consumed on the farm rather than in money should be taken into consideration in comparing the income of farm and nonfarm areas.

Comparability of census income data with Office of Business Economics State income series.--The Office of Business Economics of the Department of Commerce publishes data on aggregate and per capita personal income received by the population in each State. If the aggregate total income were estimated from the income statistics shown in this report, it would be lower than that shown in the State income series for several reasons. The income statistics published by the Bureau of the Census are obtained from households, whereas the State income series published by the Office of Business Economics is estimated largely on the basis of data derived from business and governmental sources. Moreover, the definitions of income are different. The Office of Business Economics income series includes some items not included in the income statistics shown in this report, such as income in kind, the value of the services of banks and other financial intermediaries rendered to persons without the assessment of specific charges, and the income of persons who died or emigrated prior to the time of enumeration. On the other hand, income statistics in publications of the Bureau of the Census include contributions for support received from persons not residing in the same household, and employee contributions for social insurance.

Source of data.--The statistics in this report were obtained from chapter C of 1960 Census of Population, Volume I, Characteristics of the Population, and are based on a 25-percent sample, consisting of one household out of every four (and one person out of every four not in households). More detailed definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on the sampling variability may be found in the introduction to the Volume I report cited above.

LABOR RESERVE

(The tables presented here are preprints of portions of tables 14, 15, and 16 from Final Report PC(2)-6C, which is scheduled to be published in early 1966 and which will contain additional information on the characteristics of members of the labor reserve)

In 1960, over 21.8 million persons, or 17 percent of the population 14 years old and over, were members of the labor reserve in the United States. The labor reserve is defined as those persons not in the labor force at the time of enumeration but with work experience within the preceding ten years (since 1950). Women outnumbered men in the labor reserve by more than 2 to 1, totaling some 15 million members compared with slightly fewer than 7 million male members.

There are several notable differences in the characteristics of the men and women who were members of the labor reserve. The average age of the women (33.4 years) was 26 years younger than the average age of the men (59.8 years). Teenagers and persons over 65 years of age made up 63 percent of the men but only 17 percent of the women. Besides being younger, the women members had received more formal education than their men counterparts, having completed an average of 12.0 years of school contrasted with 8.8 school years completed by the men. This difference in educational attainment between the two groups is

further reflected in the types of occupations last held by the two groups. Over 50 percent of the women in the labor reserve last worked in a white-collar occupation with 9 percent having held professional and technical jobs. The comparable rates for men in these occupations were much lower--24 percent and 5 percent, respectively.

The labor reserve includes more women than men. This is quite understandable since most men in their productive years are still participating in the labor force. For example, the labor force participation rate in 1960 for men between the ages of 25 and 64 was 92.5 percent. The labor force participation pattern for women, however, is quite different. Labor force participation declines for women in their twenties as many women leave their job to take on family responsibilities and do not return to the work force until the children are well into their school years. Thus, women constitute the source of greatest potential growth in the labor force for the Nation.

About 3 out of every 10 women in the labor reserve were last employed as clerical and

kindred workers. Those who last worked in the professional, technical, and kindred group totaled over 1.2 million and slightly over half of these last worked as professional nurses and school teachers.

Young mothers between the ages of 20 and 39 years in the labor reserve amounted to 7.3 million, or 49 percent of the female labor reserve. Of this group, 6.2 million had at least one child of preschool age at home (under 6 years old). More than two-thirds of these young mothers last worked within the past five years.

As previously noted, teenagers and persons over 65 years of age dominated the male labor reserve. Many teenagers qualified technically as members of the labor reserve on the basis of having worked during the previous summer but were currently out of the labor force attending school. This group, thus, adds only limited work experience and skills to the labor reserve.

One-third of the 6.8 million men in the labor reserve were 60 years old or over. More than half of this older group last worked as craftsmen, foremen, and kindred workers, or as operatives and kindred workers. The average number of school years completed by these men was slightly more than 8 years. Since most of them were retired, they were dependent on sources other than earnings for their income. Consequently, they had relatively low incomes, the majority receiving less than \$1,400 in 1959. For men 75 years old and over in the labor reserve, the average income in 1959 was only \$1,119. Over two-thirds of the men aged 60 years and over in the labor reserve had not worked since 1958.

All of the statistics in this report were obtained from a 5-percent sample of the 1960 Census of Population. Definitions of the concepts, explanations of the collection and processing procedures, and a statement on the sampling variability will be presented in the introduction of the 1960 Census of Population, Final Report PC(2)-6C, Labor Reserve.

PC(81)-51

MARITAL STATUS AND AGE AT FIRST MARRIAGE: 1960

(The tables presented here are preprints from tables 1, 9a, 16, and 18 of Final Report PC(2)-4D, and tables 1, 2, 8, and 10 of Final Report PC(2)-4E, which are scheduled to be published in several months and which will contain additional information on detailed characteristics of the population by marital status and age at first marriage)

About 76 percent of the men who had been married less than a year at the time of the 1960 census were married once and had a wife who had been married only once; another 11 percent had a wife who had been married more than once; and 12 percent were living apart from their wives because of military service, marital discord, or other reasons.

Among men who first married 60 years before the census, about 17,000 were still married once with a wife who had been married only once. These men represented 27 percent of all surviving men first married 60 years earlier. Most of the remainder were widowed.

Married couples with both spouses married only once had been married, on the average, about 18 years.

Among married couples enumerated in 1960, the median age of all husbands was about 44 years, and the median age of all wives was about 41 years. The median age of wife was 31 years in couples where the husband was 30 to 34 years old, 49 years where the husband was 50 to 54 years old, and 67 years where the husband was 70 to 74 years old.

About 41 percent of women who had ever been married were first married before their twentieth birthday, as compared with only 14 percent of men. Comparison of average annual marriage rates per 1,000 single persons in 1958 and 1959 based on the 1960 census reveals that the rate for girls 18 years old was three times that for boys of the same age. At age 19 the rate for girls was still twice that for boys; it remained greater until around age 25. At most ages, first marriage rates per 1,000 nonwhite single persons were lower than the corresponding rates for white persons of the same sex. The statistics by States show that New Mexico and Nevada had the highest first marriage rates for single men 14 to 44 years old, 104 per 1,000, whereas in West Virginia, the rate was only 68. For females, the highest rate was in Alaska with an average annual first marriage rate of 211 per 1,000 single women.

One of the most important factors affecting the age at which persons marry for the first time is the number of years spent in school. For example, among men 35 to 44 years old, the mean age at first marriage was 24.5 years for those completing grade school only,

For sale by the Bureau of the Census, Washington, D.C. 20233, and U.S. Department of Commerce Field Offices, 25 cents.

24.8 for those completing high school only, and 25.9 for men completing 4 years of college. Among women of the same age, the mean age at first marriage was 21.4 years for those who completed grade school only, 22.6 years for those completing high school only, and 24.6 years for women who completed 4 years of college. These figures show that completion of 4 years of college had a greater effect on the average age at first marriage of women than of men.

Although, in general, age at marriage rises with education, this relationship is not uniform. Women who started high school but failed to complete the full 4 years married at a slightly lower mean age than women with only 8 years of education.

The classification by marital status refers to the status of the person at the time of the enumeration. Persons classified as "married" comprise, therefore, both those who have been married only once and those who remarried after having been widowed or divorced. Persons "ever married" are those in the categories married (including separated), widowed, and divorced. The classification by age at first marriage was based on information on

birthdate and date of first marriage. The number of single persons in 1958 and 1959 used to calculate the first marriage rates shown in tables 6 and 7 was derived from information on marital status in 1960, birthdate, and date of first marriage.

All the statistics for 1960 in these reports were obtained from a 5-percent sample, consisting of 1 household out of every 20 (and of 1 person out of every 20 not in households). There may be differences between comparable distributions in this report and in other reports of the 1960 Census of Population because of sampling variability or errors in processing. Definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on sampling variability may be found in 1960 Census of Population, Final Report PC(2)-4D, Age at First Marriage, and PC(2)-4E, Marital Status, forthcoming.

Statistics on marital status similar to those shown for the United States in table 1 of this report are shown annually in Current Population Reports, Series P-20, on the basis of data collected by the Bureau of the Census in the Current Population Survey.

Table 1.--MARITAL STATUS--PERSONS 14 YEARS OLD AND OVER, BY AGE AND SEX, FOR THE UNITED STATES: 1960

(Based on 5-percent sample. Medians computed from single-year-of-age detail. Percent and median not shown where base is less than 1,000)

NEGRO POPULATION, BY COUNTY: 1960 AND 1950

This report presents a compilation of data from the 1960 Census on the distribution of the Negro population in the United States. Table 1 shows data for regions, divisions, and States; table 2 shows figures for counties. Both tables give the total, nonwhite, and Negro population and the percent change in the Negro population between 1950 and 1960.

All areas shown are as defined in April 1960. For Alaska, data on the Negro population are not available for 1950. For Hawaii, data on the Negro population for 1950 are available for the State total but not for counties.

The tables are based on data which appear in the separate State parts of U.S. Census of Population: 1960, Volume I, Characteristics of the Population, and U.S. Census of Population: 1950, Volume II, Characteristics of the Population.

Detailed information on the characteristics of the Negro population is published in the 1960 Census report PC(2)-1C, Nonwhite Population by Race.* A guide to the sources of 1960 Census data on the Negro population appears in the report PC(S1)-46, Subject Guide to 1960 Census Data for the Negro Population.† A map showing the percent change in the Negro population by county between 1950 and 1960 is shown in the report PC(S1)-49, Distribution of the Negro Population.† The most recent figures on the Negro population published by the Bureau of the Census are presented in Current Population Reports, Series P-20, No. 145, "Negro Population: March 1965"* which gives figures for the United States as a whole.
